

Well-posedness of a diffuse-interface model for two-phase incompressible flows with thermo-induced Marangoni effect

HAO WU *

June 28, 2016

Abstract

We investigate a non-isothermal diffuse-interface model that describes the dynamics of two-phase incompressible flows with thermo-induced Marangoni effect. The governing PDE system consists of the Navier–Stokes equations coupled with convective phase-field and energy transport equations, in which the surface tension, fluid viscosity and thermal diffusivity are allowed to be temperature dependent functions. First, we establish the existence and uniqueness of local strong solutions when the spatial dimension is two and three. Then in the two dimensional case, assuming that the L^∞ -norm of the initial temperature is suitably bounded with respect to the coefficients of the system, we prove the existence of global weak solutions as well as the existence and uniqueness of global strong solutions.

Keywords: Diffuse-interface model, Marangoni effect, Navier–Stokes equations, Well-posedness.

AMS Subject Classification: 35A01, 35A02, 35K20, 35Q35.

1 Introduction

The Marangoni effect [29,37] is an interesting phenomenon where mass transfer occurs due to differences in the surface tension that can either be attributed to non-uniform distributions of the surfactant [30] or the existence of temperature gradient in a neighborhood of the interface [33]. The Marangoni effect turns out to dominate the convection when the depth of the fluid layer is sufficiently small, and it has many important applications in complex fluids, liquid-gas systems and ocean-geophysical dynamics [3,4,41]. For instance, the so-called Bénard–Marangoni convection is a thermal convective motion due to the bulk forces resulting from the thermally induced density difference (buoyancy) and the interfacial forces resulting from the temperature-dependence of the surface tension for the free surface (thermo-capillarity, i.e., the thermal-induced Marangoni effect).

Diffuse-interface models have been shown to be very powerful and efficient for modelling the dynamics of interfaces in multi-phase systems (see, e.g., [2] and the references cited therein). In these models, sharp-interfaces of the macroscopically immiscible fluids are replaced by a thin layer (i.e., the diffuse-interface) with steep change on properties of different components. Comparing with the classical sharp-interface model, the diffuse-interface model allows for topological changes of interfaces and has many advantages in numerical simulations for the interfacial motions [10,17,23,28,40].

In this paper, we aim to investigate a diffuse-interface model proposed by Liu et al [24] (see also [15, 23, 34]) that describes the thermo-induced Marangoni effect for mixtures of two Newtonian flows (with matched density $\rho = 1$ for the sake of simplicity). In this model, a phase function ϕ is introduced as the volume fraction of the two components. Then the interaction between different components is modeled by the elastic (mixing) energy of Ginzburg–Landau type [23]:

$$E(\phi) = \int_{\Omega} \left(\frac{1}{2} |\nabla \phi|^2 + W(\phi) \right) dx. \quad (1.1)$$

The gradient part $\int_{\Omega} \frac{1}{2} |\nabla \phi|^2 dx$ represents the tendency to be homogeneous of the two-phase mixture, i.e., the “phillic” interaction, while the bulk energy $\int_{\Omega} W(\phi) dx$ represents the “phobic” interaction, or the tendency to be separated for different phases (see [23]). Here, we consider the energy density function W of the following typical form

$$W(\phi) = \frac{1}{4\varepsilon^2} (\phi^2 - 1)^2, \quad (1.2)$$

which can be viewed as a smooth double-well polynomial approximation of the physically relevant logarithmic potential [6]. The small parameter ε denotes the capillary width (i.e., width of the diffuse-interface) that reflects the competition between the two opposite tendencies [23, 28]. Then the governing PDE system (in a non-dimensional form) can be given as follows [24, 34]:

$$\begin{aligned} \mathbf{u}_t + \mathbf{u} \cdot \nabla \mathbf{u} - \nabla \cdot (2\mu(\theta) \mathcal{D} \mathbf{u}) + \nabla P \\ = -\nabla \cdot \sigma + (\text{Ra}\theta - \text{Ga})g\mathbf{e}_n, \end{aligned} \quad (t, x) \in (0, T) \times \Omega, \quad (1.3)$$

$$\nabla \cdot \mathbf{u} = 0, \quad (t, x) \in (0, T) \times \Omega, \quad (1.4)$$

$$\phi_t + \mathbf{u} \cdot \nabla \phi - \gamma(\Delta \phi - W'(\phi)) = 0, \quad (t, x) \in (0, T) \times \Omega, \quad (1.5)$$

$$\theta_t + \mathbf{u} \cdot \nabla \theta - \nabla \cdot (\kappa(\theta) \nabla \theta) = 0, \quad (t, x) \in (0, T) \times \Omega, \quad (1.6)$$

subject to the boundary and initial conditions:

$$\mathbf{u}|_{\Gamma} = \mathbf{0}, \quad \phi|_{\Gamma} = \phi_b(x), \quad \theta|_{\Gamma} = 0, \quad (t, x) \in (0, T) \times \Gamma, \quad (1.7)$$

$$\mathbf{u}|_{t=0} = \mathbf{u}_0(x), \quad \phi|_{t=0} = \phi_0(x), \quad \theta|_{t=0} = \theta_0(x), \quad x \in \Omega. \quad (1.8)$$

Here, Ω is assumed to be a bounded domain in \mathbb{R}^n ($n = 2, 3$) with smooth boundary Γ . Functions \mathbf{u} , P and θ stand for the fluid velocity, the pressure, and the relative temperature (with respect to the background temperature θ_b , which is assumed to be a constant here for the sake of simplicity), respectively. In the Navier–Stokes equation (1.3), $\mathcal{D} \mathbf{u} = \frac{1}{2}(\nabla \mathbf{u} + \nabla^T \mathbf{u})$ corresponds to the symmetric part of the velocity gradient. The term $(\text{Ra}\theta - \text{Ga})g\mathbf{e}_n$ denotes the buoyancy force, in which g is the gravitational acceleration constant and the constants Ra , Ga are related to the Rayleigh number and Galileo number, respectively. The constant $\gamma > 0$ in (1.5) represents the elastic relaxation time. The induced stress tensor σ in (1.3) can be derived within the energetic variational framework by using the least action principle (see [24, 34] and also [15]) such that

$$\sigma = \lambda(\theta) \nabla \phi \otimes \nabla \phi + \lambda(\theta) \left(\frac{1}{2} |\nabla \phi|^2 + W(\phi) \right) \mathbb{I}. \quad (1.9)$$

In the formula (1.9), the symbol \otimes denotes the usual Kronecker product, i.e., $(\mathbf{a} \otimes \mathbf{b})_{ij} = a_i b_j$ for vectors $\mathbf{a}, \mathbf{b} \in \mathbb{R}^n$ and \mathbb{I} is the $n \times n$ identity matrix. In order to model the thermal induced

Marangoni effect, the temperature dependent surface tension coefficient λ is approximated by the Eötvös rule and it takes the form of a linear function on the temperature such that

$$\lambda(\theta) = \lambda_0(a - b\theta),$$

where the coefficients $\lambda_0 > 0$, $a > 0$, $b \neq 0$ are assumed to be constants (see [15, 24, 34], and also [3, 4]). The coefficient λ_0 is proportional to the interface width ε , while the constants a and b are related to the capillary number and the Marangoni number, respectively (see [15]).

In this paper, we consider the general case that the fluid viscosity μ and the thermal diffusivity κ are also allowed to depend on the temperature θ , which are physically important in the study of non-isothermal fluids (see, e.g., [25] and references cited therein). More precisely, throughout the paper $\mu(\cdot)$ and $\kappa(\cdot)$ are supposed to be strictly positive smooth functions defined on \mathbb{R} that satisfy

$$\mu(\cdot), \kappa(\cdot) \in C^2(\mathbb{R}) \quad \text{and} \quad \mu(s) > 0, \quad \kappa(s) > 0, \quad \forall s \in \mathbb{R}. \quad (1.10)$$

We remark that thanks to the maximum principle for the temperature variable θ (see Lemma 3.4), no positive upper and lower bounds for $\mu(\cdot)$, $\kappa(\cdot)$ will be assumed (see Remark 3.1.3 and Section 4).

The goal of this paper is to study well-posedness of the initial boundary value problem (1.3)–(1.8) under the general assumption (1.10). We shall first establish the existence and uniqueness of local strong solutions in both $2D$ and $3D$ cases (see Theorem 2.1). Then in the $2D$ case, under the assumption that the L^∞ -norm of the initial temperature θ_0 is suitably bounded with respect to those coefficients of the PDE system (1.3)–(1.6), we prove the existence of global weak solutions (see Theorem 2.2) as well as the existence and uniqueness of global strong solutions (see Theorem 2.3).

The coupled system (1.3)–(1.6) is a highly nonlinear PDE system that consists of the Navier–Stokes equations for the velocity \mathbf{u} , a convective Allen–Cahn type equation for the phase function ϕ and an energy transport equation for the temperature θ . It contains the well-known Navier–Stokes–Allen–Cahn system [11, 12, 14, 23, 34] and the heat-conductive Boussinesq system [16, 18–20, 27, 35] as subsystems. A simplified version of the system (1.3)–(1.6) with *constant* viscosity and thermal diffusivity has recently been considered in [39], where the authors proved the existence of global weak/strong solutions and investigated its long-time behavior as well as stability properties. However, because of the temperature-dependent fluid viscosity and thermal diffusivity, the arguments therein fail to apply here.

The major challenges in mathematical analysis of the problem (1.3)–(1.8) come from the highly nonlinear couplings between those equations due to the temperature-dependence of the surface tension parameter λ , the fluid viscosity μ and the thermal diffusivity κ . The strong nonlinear structure of problem (1.3)–(1.8) brings us many difficulties to obtain necessary *a priori* estimates. Similar difficulties have been found for the Boussinesq system with temperature dependent viscosity and thermal diffusivity (namely, without coupling with the phase-field equation in system (1.3)–(1.6), and the nonlinearity of the highest-order in the Navier–Stokes equations, i.e., the induced capillary stress tensor σ , is neglected). We refer to [27] for the existence of global weak solutions as well as the existence and uniqueness of local strong solutions for general data in both $2D$ and $3D$, see also [26] for the existence of global strong solutions with small initial data. When the spatial dimension is two, global existence of strong solutions either in a bounded domain or in the whole space has been proved in [35, 38], while in [18] the global attractor was established in a periodic channel. We also refer to [20], where global well-posedness and long-time behavior were proved for the $2D$

Boussinesq system with partial dissipation (i.e., non-constant thermal diffusivity and zero fluid viscosity). In these previous works, delicate estimates were performed to overcome the related mathematical difficulties. It is worth noting that our non-isothermal diffuse-interface system (1.3)–(1.8) has an even more complicated coupling structure than the classical Boussinesq system mentioned above. The temperature dependence of the surface tension λ destroys the energy dissipation property of problem (1.3)–(1.8), which is important for the existence of global weak/strong solutions. To this end, we recall that the isothermal version of system (1.3)–(1.6) without the Boussinesq approximation term obeys the following dissipative energy law (see e.g., [15, 17, 24, 34])

$$\begin{aligned} & \frac{d}{dt} \left[\frac{1}{2} \int_{\Omega} |\mathbf{u}|^2 dx + \lambda \int_{\Omega} \left(\frac{1}{2} |\nabla \phi|^2 + W(\phi) \right) dx \right] \\ &= -\mu \int_{\Omega} |\nabla \mathbf{u}|^2 dx - \lambda \gamma \int_{\Omega} |-\Delta \phi + W'(\phi)|^2 dx, \end{aligned} \quad (1.11)$$

which provides the energy-level estimate of solutions to the isothermal Navier–Stokes–Allen–Cahn system and plays an essential role in the study of its well-posedness as well as long-time behavior (see [12, 14]). There, certain special cancellation between the highly nonlinear induced stress term σ in equation (1.3) and the convection term $\mathbf{u} \cdot \nabla \phi$ in equation (1.5) is crucial for the derivation of (1.11) (see [12, 40], see also [22] for the nematic liquid crystal system). However, for our problem (1.3)–(1.8) with temperature dependent surface tension coefficient λ , similar dissipative energy law like (1.11) cannot be expected in general, because the specific cancellation mentioned above is no longer valid.

We shall generalize several techniques in the literature to overcome the mathematical difficulties due to those strong nonlinear couplings caused by the temperature dependent coefficients. For instance, since the energy-level estimates and higher-order estimates for problem (1.3)–(1.8) with general initial data cannot be obtained in a separate way, in order to prove the existence of local strong solutions, we try to construct a novel higher-order differential inequality (see Lemma 3.6) and combine it with a small data argument for the shifted temperature $\hat{\theta} = \theta - \theta_0$ in the spirit of [27]. On the other hand, maximum principles for the phase function ϕ and the temperature θ (see Lemmas 3.3, 3.4) are crucial to reduce the difficulties from high-order nonlinearities. In particular, we find that if the L^∞ -norm of the initial temperature is properly bounded (only depending on coefficients of the system and the domain Ω , but not on the initial data), we are able to obtain some global estimates (see Propositions 4.1, 4.2) and prove the existence of global weak as well as strong solutions in $2D$. Some dissipative estimates of the system can also be revealed (see Lemma 4.1), which further imply the long-time convergence of global strong solutions. Besides, in order to obtain higher-order spatial estimates for the velocity \mathbf{u} and the temperature θ , one need to make use of a suitable temperature transformation (3.5) induced by the temperature dependent thermal diffusivity κ as well as properties of the Stokes problem with non-constant viscosity (see e.g., [35]).

The current work can be viewed as a preliminary step towards the theoretical analysis of some more refined diffuse-interface models. As we shall see, the L^∞ -estimate for the phase function ϕ turns out to be crucial in the subsequent analysis. It is an open question whether results similar to those for the system (1.3)–(1.8) can be obtained if the Allen–Cahn type equation (1.5) is replaced by the Cahn–Hilliard equation [6], which is a fourth-order parabolic equation preserving the total mass $\int_{\Omega} \phi dx$ but losing the maximum principle for the phase function ϕ (see, e.g., [2, 15, 23, 34]). We refer to [1, 5, 13, 14] and the references cited therein for analysis on the isothermal Navier–Stokes–Cahn–Hilliard systems. It is worth mentioning that

in the recent work [8, 9], a thermodynamically consistent diffuse-interface model describing two-phase flows of incompressible fluids in a non-isothermal setting has been proposed and analyzed (with constant surface tension coefficient λ). It would be interesting to include Marangoni effects in the model studied therein. At last, we also refer to [42] for the Cahn–Hilliard–Boussinesq equation with the specific assumption that λ and κ are positive constants and $\mu = 0$.

The remaining part of this paper is organized as follows. In Section 2, we introduce the functional settings and state the main results. Section 3 is devoted to the existence and uniqueness of local strong solutions to problem (1.3)–(1.8) with general initial data in both $2D$ and $3D$ cases (see Theorem 2.1). In Section 4, under suitable assumptions on the L^∞ -norm of the initial temperature θ_0 , we first establish the existence of global weak solutions (Theorem 2.2) and then prove the existence as well as uniqueness of global strong solutions in $2D$ (see Theorem 2.3). In the Appendix, we briefly sketch the semi-Galerkin approximate schemes that are used in the proofs for existence results.

2 Preliminaries and Main Results

2.1 Functional setup and notations

Let X be a Banach or Hilbert space, whose norm is denoted by $\|\cdot\|_X$. X' indicates the dual space of X and $\langle \cdot, \cdot \rangle_{X', X}$ denotes the corresponding duality products. The boldface letter \mathbf{X} stands for the vectorial space X^n endowed with the product structure. We denote by $L^p(\Omega)$ and $W^{m,p}(\Omega)$ the usual Lebesgue spaces and Sobolev spaces of real measurable functions on the domain Ω . When $p = 2$, $W^{m,p}(\Omega)$ will be denoted by $H^m(\Omega)$ and in particular, $H^0(\Omega) = L^2(\Omega)$. $H_0^1(\Omega)$ is the closure of $C_0^\infty(\Omega)$ in the H^1 -norm, and its dual space is simply denoted by $H^{-1}(\Omega)$. We denote the Hölder space on Ω by $C^\alpha(\overline{\Omega})$ with $\alpha \in (0, 1)$. For any $f \in C^\alpha(\overline{\Omega})$, $[f]_\alpha$ represents the Hölder semi-norm of f that $[f]_\alpha = \sup_{x,y \in \Omega, x \neq y} \frac{|f(x) - f(y)|}{|x - y|^\alpha}$. If I is an interval of \mathbb{R}^+ , we use the function space $L^p(I; X)$ with $1 \leq p \leq +\infty$, which consists of p -integrable functions with values in the Banach space X . For the sake of simplicity, the inner product in $L^2(\Omega)$ and its associate norm will be denoted by (\cdot, \cdot) and $\|\cdot\|$, respectively.

Let $\mathcal{V} = \{\mathbf{u} \in C_0^\infty(\Omega, \mathbb{R}^n), \nabla \cdot \mathbf{u} = 0 \text{ in } \Omega\}$. We denote the space \mathbf{H} (or \mathbf{V}) the closure of \mathcal{V} in $\mathbf{L}^2(\Omega)$ (or $\mathbf{H}_0^1(\Omega)$):

$$\begin{aligned}\mathbf{H} &= \{\mathbf{u} \in \mathbf{L}^2(\Omega) : \nabla \cdot \mathbf{u} = 0 \text{ in } \Omega, \mathbf{u} \cdot \mathbf{n} = 0 \text{ on } \Gamma\}, \\ \mathbf{V} &= \{\mathbf{u} \in \mathbf{H}_0^1(\Omega) : \nabla \cdot \mathbf{u} = 0 \text{ in } \Omega\}.\end{aligned}$$

Hence, \mathbf{H} and \mathbf{V} are Hilbert spaces with norms $\|\cdot\|$ and $\|\cdot\|_{\mathbf{H}^1}$, respectively.

Let Π be the orthogonal projection of $\mathbf{L}^2(\Omega)$ onto \mathbf{H} related to the usual Helmholtz decomposition. We recall the Stokes operator $S : \mathbf{H}^2(\Omega) \cap \mathbf{V} \rightarrow \mathbf{H}$ such that for all $\mathbf{u} \in D(S) := \mathbf{H}^2(\Omega) \cap \mathbf{V}$, $S\mathbf{u} = \Pi(-\Delta\mathbf{u}) = -\Delta\mathbf{u} + \nabla\pi \in \mathbf{H}$. It is well-known that its inverse S^{-1} is a compact linear operator on \mathbf{H} and $\|S \cdot\|$ gives a norm on $D(S)$ that is equivalent to the usual \mathbf{H}^2 -norm. Besides, we have the following estimates (see [27, Lemma 3.4] and [36])

Lemma 2.1. *For any $\mathbf{u} \in D(S)$, consider the Helmholtz decomposition $S\mathbf{u} = -\Delta\mathbf{u} + \nabla\pi$ where the pressure π is taken such that $\int_\Omega \pi dx = 0$. Then for any $\nu > 0$, there exists a positive constant C_ν independent of \mathbf{u} , it holds*

$$\|\pi\| \leq \nu \|S\mathbf{u}\| + C_\nu \|\nabla\mathbf{u}\|. \quad (2.1)$$

Moreover, there exists a positive constant $c = c(n, \Omega)$ such that

$$\|\mathbf{u}\|_{\mathbf{H}^2} + \|\pi\|_{H^1 \setminus \mathbb{R}} \leq c \|S\mathbf{u}\|. \quad (2.2)$$

In the following text, for two $n \times n$ matrices M_1, M_2 , we denote $M_1 : M_2 = \text{trace}(M_1 M_2^T)$. The upper case letters C, C_i will stand for genetic constants possibly depending on the domain Ω , the coefficients $a, b, \lambda_0, \mu, \kappa, \gamma, \varepsilon$ as well as the boundary and initial data, while lower case letters c, c_i will denote interpolation/embedding constants that only depend on Ω and also the spatial dimension n . These constants may vary in the same line in the subsequent estimates and their special dependence will be pointed out explicitly in the text if necessary.

2.2 Main results

Now we introduce the notions of weak and strong solutions to problem (1.3)–(1.8) considered in this paper:

Definition 2.1 (Weak solutions). *Let $n = 2$. For any $T \in (0, +\infty)$, $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{H} \times (H^1(\Omega) \cap L^\infty(\Omega)) \times (H_0^1(\Omega) \cap L^\infty(\Omega))$ with $\phi_b \in H^{\frac{3}{2}}(\Gamma)$ and $\phi_0|_\Gamma = \phi_b$, the triple $(\mathbf{u}, \phi, \theta)$ satisfying*

$$\mathbf{u} \in L^\infty(0, T; \mathbf{H}) \cap L^2(0, T; \mathbf{V}), \quad (2.3)$$

$$\phi \in L^\infty(0, T; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T; H^2(\Omega)), \quad (2.4)$$

$$\theta \in L^\infty(0, T; H_0^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T; H^2(\Omega)), \quad (2.5)$$

$$\mathbf{u}_t \in L^2(0, T; \mathbf{V}'), \quad \phi_t, \theta_t \in L^2(0, T; L^2(\Omega)), \quad (2.6)$$

is called a weak solution of problem (1.3)–(1.8), if

$$\begin{aligned} & \langle \mathbf{u}_t, \mathbf{v} \rangle_{\mathbf{V}', \mathbf{V}} + \int_{\Omega} (\mathbf{u} \cdot \nabla) \mathbf{u} \cdot \mathbf{v} dx + 2 \int_{\Omega} \mu(\theta) \mathcal{D} \mathbf{u} : \mathcal{D} \mathbf{v} dx \\ &= \int_{\Omega} [\lambda(\theta) \nabla \phi \otimes \nabla \phi] : \nabla \mathbf{v} dx + \int_{\Omega} \theta \mathbf{g} \cdot \mathbf{v} dx, \quad \forall \mathbf{v} \in \mathbf{V}, \\ & \phi_t + \mathbf{u} \cdot \nabla \phi + \gamma(-\Delta \phi + W'(\phi)) = 0, \quad \text{a.e. in } (0, T) \times \Omega, \\ & \theta_t + \mathbf{u} \cdot \nabla \theta - \nabla \cdot (\kappa(\theta) \nabla \theta) = 0, \quad \text{a.e. in } (0, T) \times \Omega, \end{aligned}$$

and it fulfills the boundary conditions $\phi|_\Gamma = \phi_b$, $\theta|_\Gamma = 0$ as well as the initial conditions in (1.8). Here we simply denote the vector $\mathbf{g} = \text{Rag} \mathbf{e}_n$.

Remark 2.1. (1) In the above variational form for the fluid velocity \mathbf{u} , we have used the following facts due to the incompressibility condition (1.4) such that for any $\mathbf{v} \in \mathbf{V}$, it holds

$$\int_{\Omega} \left\{ \nabla \cdot \left[\lambda(\theta) \left(\frac{1}{2} |\nabla \phi|^2 + W'(\phi) \right) \mathbb{I} \right] \right\} \cdot \mathbf{v} dx = \int_{\Omega} \nabla P \cdot \mathbf{v} dx = \int_{\Omega} \mathbf{e}_n \cdot \mathbf{v} dx = 0.$$

We have written the buoyancy force as $(\text{Ra}\theta - \text{Ga})\mathbf{g} \mathbf{e}_n = \theta \mathbf{g} - \text{Ga} \mathbf{e}_n$, then the part $-\text{Ga} \mathbf{e}_n$ can be simply absorbed into the pressure P .

(2) By the interpolation theorem [32], it easily follows that $\mathbf{u} \in C([0, T]; \mathbf{H})$ and also $\phi, \theta \in C([0, T]; H^1(\Omega))$. Thus the initial condition (1.8) make sense.

Definition 2.2 (Strong solutions). *Let $n = 2, 3$. For any $T \in (0, +\infty)$, $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{V} \times H^2(\Omega) \times (H^2(\Omega) \cap H_0^1(\Omega))$ with $\phi_b \in H^{\frac{5}{2}}(\Gamma)$ and $\phi_0|_\Gamma = \phi_b$, we say that the triple $(\mathbf{u}, \phi, \theta)$ is a strong solution to problem (1.3)–(1.8), if*

$$\mathbf{u} \in L^\infty(0, T; \mathbf{V}) \cap L^2(0, T; \mathbf{H}^2(\Omega)) \cap H^1(0, T; \mathbf{H}),$$

$$\begin{aligned}
\phi &\in L^\infty(0, T; H^2(\Omega)) \cap L^2(0, T; H^3(\Omega)), \\
\phi_t &\in L^\infty(0, T; L^2(\Omega)) \cap L^2(0, T; H_0^1(\Omega)) \\
\theta &\in L^\infty(0, T; H^2(\Omega) \cap H_0^1(\Omega)) \cap L^2(0, T; H^3(\Omega)), \\
\theta_t &\in L^\infty(0, T; L^2(\Omega)) \cap L^2(0, T; H_0^1(\Omega)),
\end{aligned}$$

and $(\mathbf{u}, \phi, \theta)$ satisfies the system (1.3)–(1.6) a.e. in $[0, T] \times \Omega$ as well as the boundary and initial conditions (1.7)–(1.8).

Now we state the main results of this paper.

(A) *Local strong solutions in both 2D and 3D.*

Theorem 2.1. *Let $n = 2, 3$. Suppose that $\mu(\cdot)$ and $\kappa(\cdot)$ fulfill the assumption (1.10). For any initial data $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{V} \times H^2(\Omega) \times (H^2(\Omega) \cap H_0^1(\Omega))$, $\phi_b \in H^{\frac{5}{2}}(\Gamma)$ with $\phi_0|_\Gamma = \phi_b$ satisfying $|\phi_0| \leq 1$ in Ω and $|\phi_b| \leq 1$ on Γ , there exists a time $T^* > 0$ depending on $\|\mathbf{u}_0\|_{\mathbf{V}}$, $\|\phi_0\|_{H^2}$, $\|\theta_0\|_{H^2}$, Ω and coefficients of the system such that problem (1.3)–(1.8) admits a unique local strong solution $(\mathbf{u}, \phi, \theta)$ on $[0, T^*]$.*

(B) *Global weak solutions in 2D under bounded initial temperature variation.*

Theorem 2.2. *Let $n = 2$. Suppose that $\mu(\cdot)$ and $\kappa(\cdot)$ fulfill the assumption (1.10). For any initial data $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{H} \times (H^1(\Omega) \cap L^\infty(\Omega)) \times (H_0^1(\Omega) \cap L^\infty(\Omega))$, $\phi_b \in H^{\frac{3}{2}}(\Gamma)$ with $\phi_0|_\Gamma = \phi_b$ satisfying $|\phi_0| \leq 1$ a.e. in Ω and $|\phi_b| \leq 1$ on Γ , we consider problem (1.3)–(1.8).*

(1) *There exists a constant $\Theta_1 > 0$ depending only on Ω , the viscosity function $\mu(\cdot)$, and the coefficients γ , λ_0 , a , b (see (4.4) for its detailed form), such that if we further assume $\|\theta_0\|_{L^\infty} \leq \Theta_1$, then for arbitrary time $T \in (0, +\infty)$, problem (1.3)–(1.8) admits at least one global weak solution $(\mathbf{u}, \phi, \theta)$ on $[0, T]$.*

(2) *There exists a constant $\Theta_2 \in (0, \Theta_1]$ depending on Θ_1 , the thermal diffusivity $\kappa(\cdot)$ and Ω (see (4.9) for its detailed form) such that if we further assume $\|\theta_0\|_{L^\infty} \leq \Theta_2$, then problem (1.3)–(1.8) admits at least one global weak solution $(\mathbf{u}, \phi, \theta)$ on $[0, +\infty)$, which is uniformly bounded in $\mathbf{H} \times (H^1(\Omega) \cap L^\infty(\Omega)) \times (H_0^1(\Omega) \cap L^\infty(\Omega))$ for all $t \geq 0$.*

(C) *Global strong solutions in 2D under bounded initial temperature variation.*

Theorem 2.3. *Let $n = 2$. Suppose that $\mu(\cdot)$ and $\kappa(\cdot)$ fulfill the assumption (1.10). For any initial data $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{V} \times H^2(\Omega) \times (H^2(\Omega) \cap H_0^1(\Omega))$, $\phi_b \in H^{\frac{5}{2}}(\Gamma)$ with $\phi_0|_\Gamma = \phi_b$ satisfying $|\phi_0| \leq 1$ in Ω , $|\phi_b| \leq 1$ on Γ , we consider problem (1.3)–(1.8).*

(1) *If θ_0 satisfies $\|\theta_0\|_{L^\infty} \leq \Theta_1$ (see (4.4)), then for arbitrary time $T \in (0, +\infty)$, problem (1.3)–(1.8) admits a unique global strong solution $(\mathbf{u}, \phi, \theta)$ on $[0, T]$.*

(2) *If θ_0 satisfies $\|\theta_0\|_{L^\infty} \leq \Theta_2$ (see (4.9)), then problem (1.3)–(1.8) admits a unique global strong solution $(\mathbf{u}, \phi, \theta)$ on $[0, +\infty)$ that is uniformly bounded in $\mathbf{V} \times H^2(\Omega) \times H^2(\Omega)$ for all $t \geq 0$. Moreover, we have*

$$\lim_{t \rightarrow +\infty} (\|\mathbf{u}(t)\|_{\mathbf{V}} + \|\Delta\phi(t) - W'(\phi(t))\| + \|\theta(t)\|_{H^2}) = 0.$$

Remark 2.2. *Similar results could be obtained for other types of boundary conditions with minor modifications in the proofs. For instance, the no-slip boundary condition on \mathbf{u} could be replaced by the free-slip boundary condition, while the Dirichlet boundary condition for ϕ could be replaced by the homogeneous Neumann boundary condition that accounts for an angle condition of the interface on the boundary $\partial\Omega$. Besides, the homogeneous Dirichlet boundary condition for θ can be easily generalized to a non-homogeneous one by using the shifting method in [27].*

3 Local Well-posedness

In this section, we prove the existence and uniqueness of local strong solutions to problem (1.3)–(1.8) in both $2D$ and $3D$. Due to the highly nonlinear structure of the system, the derivation of proper *a priori* higher-order estimates are much more involved than the case with constant coefficients.

3.1 Preliminaries

3.1.1 Useful inequalities

First, we recall some inequalities that will be frequently used in this paper. For the sake of convenience, we will interchangeably use the following equivalent norms:

$$\begin{aligned} \|\nabla f\| &\simeq \|f\|_{H^1}, \quad \forall f \in H_0^1(\Omega), \quad \|\Delta f\| \simeq \|f\|_{H^2}, \quad \forall f \in H^2(\Omega) \cap H_0^1(\Omega), \\ \|\nabla \mathbf{u}\| &\simeq \|\mathbf{u}\|_{\mathbf{V}}, \quad \forall \mathbf{u} \in \mathbf{V}, \quad \|\Delta \mathbf{u}\| \simeq \|\mathbf{u}\|_{\mathbf{H}^2}, \quad \forall \mathbf{u} \in \mathbf{H}^2(\Omega) \cap \mathbf{V}. \end{aligned}$$

Next, for the elliptic boundary value problem $-\Delta g = h$ with nonhomogeneous Dirichlet boundary condition $g|_{\Gamma} = g_b$, we deduce from the classical elliptic regularity theorem that

$$\|g\|_{H^{k+2}(\Omega)} \leq c(n, \Omega) \left(\|h\|_{H^k(\Omega)} + \|g\| + \|g_b\|_{H^{\frac{2k+3}{2}}(\Gamma)} \right), \quad k = \{0, 1\}.$$

The following interpolation inequalities can be found in classical literature, e.g., [36]:

Lemma 3.1 (Gagliardo–Nirenberg inequality). *Let j, m be arbitrary integers satisfying $0 \leq j < m$ and let $1 \leq q, r \leq +\infty$, $\frac{j}{m} \leq a \leq 1$ such that*

$$\frac{1}{p} - \frac{j}{n} = a \left(\frac{1}{r} - \frac{m}{n} \right) + (1-a) \frac{1}{q}.$$

Suppose $\Omega \in \mathbb{R}^n$ is a bounded domain with smooth boundary. For any $f \in W^{m,r}(\Omega) \cap L^q(\Omega)$, there are two constants c_1, c_2 such that

$$\|\partial^j f\|_{L^p} \leq c_1 \|\partial^m f\|_{L^r}^a \|f\|_{L^q}^{1-a} + c_2 \|f\|_{L^q},$$

with the following exception: if $1 < r < +\infty$ and $m - j - \frac{n}{r}$ is a nonnegative integer, then the above inequality holds only for $\frac{j}{m} \leq a < 1$.

Lemma 3.2 (Agmon’s inequality). *Suppose that $\Omega \in \mathbb{R}^n$ ($n = 2, 3$) is a bounded domain with smooth boundary. For any $f \in H^2(\Omega)$, it holds*

$$\|f\|_{L^\infty} \leq c \|f\|_{L^2}^{\frac{1}{2}} \|f\|_{H^2}^{\frac{1}{2}}, \quad \text{if } n = 2, \quad \text{and} \quad \|f\|_{L^\infty} \leq c \|f\|_{H^1}^{\frac{1}{2}} \|f\|_{H^2}^{\frac{1}{2}}, \quad \text{if } n = 3.$$

3.1.2 Maximum principles for ϕ and θ

One important feature of problem (1.3)–(1.8) is that the phase function ϕ and the temperature θ satisfy suitable weak maximum principles. These facts will be important in our subsequent proofs.

First, thanks to the double-well structure of $W(\phi)$ (see (1.2)), similar to the simplified Ericksen–Leslie system for nematic liquid crystal flows [7, 22], one can easily prove that

Lemma 3.3. *Let $n = 2, 3$. Consider the initial boundary value problem*

$$\begin{cases} \phi_t + \mathbf{u} \cdot \nabla \phi = \gamma(\Delta \phi - W'(\phi)), & (t, x) \in (0, T) \times \Omega, \\ \phi|_{\Gamma} = \phi_b(x), & (t, x) \in (0, T) \times \Gamma, \\ \phi|_{t=0} = \phi_0(x), & x \in \Omega. \end{cases} \quad (3.1)$$

Suppose that $\mathbf{u} \in L^\infty(0, T; \mathbf{H}) \cap L^2(0, T; \mathbf{V})$, $\phi_0 \in H^1(\Omega)$, $\phi_b \in H^{\frac{3}{2}}(\Gamma)$ and $\phi_0|_{\Gamma} = \phi_b$ satisfying $|\phi_0| \leq 1$ a.e. in Ω , $|\phi_b| \leq 1$ on Γ . If $\phi \in L^\infty(0, T; H^1(\Omega)) \cap L^2(0, T; H^2(\Omega))$ is a weak solution to problem (3.1), then $|\phi(t, x)| \leq 1$, a.e. in Ω for all $t \in [0, T]$.

Next, concerning the temperature equation with convection, we have the following L^∞ -estimate for θ (see [27]):

Lemma 3.4. *Let $n = 2, 3$ and $\kappa(\cdot)$ satisfies (1.10). Consider the initial boundary value problem*

$$\begin{cases} \theta_t + \mathbf{u} \cdot \nabla \theta = \nabla \cdot (\kappa(\theta) \nabla \theta), & (t, x) \in (0, T) \times \Omega, \\ \theta|_{\Gamma} = 0, & (t, x) \in (0, T) \times \Gamma, \\ \theta|_{t=0} = \theta_0(x), & x \in \Omega. \end{cases} \quad (3.2)$$

Suppose that $\theta_0(x) \in L^\infty(\Omega)$ and $\mathbf{u} \in L^\infty(0, T; \mathbf{H}) \cap L^2(0, T; \mathbf{V})$, in addition, when $n = 3$ we also assume $\mathbf{u} \in L^\infty(0, T; \mathbf{L}^3(\Omega))$. If $\theta \in L^\infty(0, T; L^2(\Omega)) \cap L^2(0, T; H_0^1(\Omega))$ is a weak solution of problem (3.2), then $\|\theta(t)\|_{L^\infty(\Omega)} \leq \|\theta_0\|_{L^\infty(\Omega)}$ for all $t \in [0, T]$.

3.1.3 Modifications of the viscosity and thermal diffusivity

Thanks to the maximum principle for the temperature θ (i.e., Lemma 3.4), in the study of local strong solutions ($n = 2, 3$), inspired by the argument in [25, 27], one can first transform the original problem (1.3)–(1.8) into an equivalent one by properly modifying the fluid viscosity $\mu(\cdot)$ and the thermal diffusivity $\kappa(\cdot)$ that are only assumed to satisfy (1.10) *outside* the interval $[-\|\theta_0\|_{L^\infty}, \|\theta_0\|_{L^\infty}]$ (here assuming that $\|\theta_0\|_{L^\infty} > 0$). In particular, this type of modification will have no influence on the L^∞ -estimate for θ .

Remark 3.1. *The case $\|\theta_0\|_{L^\infty} = 0$ is trivial. Indeed, by Lemma 3.4, we have $\theta = 0$ and thus problem (1.3)–(1.8) will be simply reduced to the isothermal Navier–Stokes–Allen–Cahn system [12, 14]. Therefore, throughout the paper, we shall focus on the nontrivial case $\|\theta_0\|_{L^\infty} > 0$.*

The required modification can be constructed in a simple way. For instance, taking

$$r = \frac{1}{3} \|\theta_0\|_{L^\infty} > 0,$$

we introduce the cut-off function $h(s) \in C_0^\infty(\mathbb{R})$ such that

$$h(s) = (\mathbf{1}_{[-4r, 4r]} * g_r)(s) = \int_{\mathbb{R}} \mathbf{1}_{[-4r, 4r]}(\tau) g_r(s - \tau) d\tau,$$

where $\mathbf{1}_{[-4r, 4r]}$ is the characteristic function on the interval $[-4r, 4r]$ and

$$g_r(s) = \left(\int_{\mathbb{R}} g(s) ds \right)^{-1} r^{-1} g\left(\frac{s}{r}\right) \quad \text{with} \quad g(s) = \begin{cases} \exp\left(\frac{1}{s^2-1}\right), & \text{if } |s| < 1, \\ 0, & \text{if } |s| \geq 1. \end{cases}$$

It easily follows that $h(s) = 1$ for $|s| \leq 3r$, $0 < h(s) < 1$ for $|s| \in (3r, 5r)$, and $h(s) = 0$ for $|s| \geq 5r$. Denote

$$\begin{aligned}\underline{\mu} &= \frac{1}{2} \inf\{\mu(s) : |s| \leq 5r\}, & \overline{\mu} &= 2 \sup\{\mu(s) : |s| \leq 5r\}, \\ \underline{\kappa} &= \frac{1}{2} \inf\{\kappa(s) : |s| \leq 5r\}, & \overline{\kappa} &= 2 \sup\{\kappa(s) : |s| \leq 5r\}.\end{aligned}$$

Then we set for $s \in \mathbb{R}$

$$\mu^*(s) = (\mu(s) - \underline{\mu})h(s) + \underline{\mu} \quad \text{and} \quad \kappa^*(s) = (\kappa(s) - \underline{\kappa})h(s) + \underline{\kappa}.$$

It is easy to verify that the modified functions $\mu^*(\cdot)$ and $\kappa^*(\cdot)$ belong to $C^2(\mathbb{R})$ and satisfy

$$\mu^*(s) = \mu(s), \quad \kappa^*(s) = \kappa(s), \quad \forall s \in [-\|\theta_0\|_{L^\infty}, \|\theta_0\|_{L^\infty}].$$

Moreover, $\mu^*(\cdot)$ and $\kappa^*(\cdot)$ are positive constants outside the interval $(-5r, 5r)$. As a result,

$$0 < \underline{\mu} \leq \mu^*(s) \leq \overline{\mu}, \quad 0 < \underline{\kappa} \leq \kappa^*(s) \leq \overline{\kappa}, \quad \forall s \in \mathbb{R}, \quad (3.3)$$

$$(\mu^*)', \quad (\mu^*)'', \quad (\kappa^*)', \quad (\kappa^*)'' \quad \text{are bounded}, \quad \forall s \in \mathbb{R}. \quad (3.4)$$

Remark 3.2. *In the remaining part of Section 3, we shall assume that the fluid viscosity $\mu(\cdot)$ and thermal diffusivity $\kappa(\cdot)$ are modified to be $\mu^*(\cdot)$ and $\kappa^*(\cdot)$ respectively as in the above argument and drop the superscript $*$ for the sake of simplicity. Then necessary estimates are always obtained along with these modified coefficients satisfying the properties (3.3), (3.4).*

3.1.4 Variable transformation for θ

In order to overcome the difficulty from the temperature-dependence of the thermal diffusivity κ in equation (1.6), we introduce the new variable ϑ in spirit of [35]:

$$\vartheta = \int_0^\theta \kappa(s) ds. \quad (3.5)$$

Since κ is a positive C^2 function, there exists a strictly increasing C^3 function $\chi(\cdot)$ such that $\chi(\vartheta) = \chi(\int_0^\vartheta \kappa(s) ds) = \theta$ and

$$\chi'(\vartheta) = \frac{1}{\kappa(\theta)}, \quad \chi''(\vartheta) = -\frac{\kappa'(\theta)}{\kappa^3(\theta)}, \quad \chi'''(\vartheta) = -\frac{\kappa''(\theta)}{\kappa^4(\theta)} + \frac{3\kappa'(\theta)^2}{\kappa^5(\theta)}.$$

Under the transformation (3.5), equation (1.6) for θ can be re-written into the following form in terms of the new variable ϑ

$$\begin{cases} \vartheta_t + \mathbf{u} \cdot \nabla \vartheta - \frac{1}{\chi'(\vartheta)} \Delta \vartheta = 0, & (t, x) \in (0, T) \times \Omega, \\ \vartheta|_\Gamma = 0, & (t, x) \in (0, T) \times \Gamma, \\ \vartheta|_{t=0} = \vartheta_0(x) = \int_0^{\theta_0(x)} \kappa(s) ds, & x \in \Omega. \end{cases} \quad (3.6)$$

On the other hand, by definition of ϑ , we can deduce from subsection 3.1.3 (see Remark 3.2) the following estimates and relations on norms of θ and ϑ :

$$\|\vartheta_0\|_{L^\infty} \leq \overline{\kappa} \|\theta_0\|_{L^\infty}, \quad \|\vartheta_0\|_{H^1} \leq \overline{\kappa} \|\theta_0\|_{H^1}, \quad \underline{\kappa} \leq \frac{1}{\chi'(\vartheta)} \leq \overline{\kappa}. \quad (3.7)$$

$$\underline{\kappa} \|\theta_t\| \leq \|\vartheta_t\| \leq \overline{\kappa} \|\theta_t\|, \quad \underline{\kappa} \|\nabla \theta\| \leq \|\nabla \vartheta\| \leq \overline{\kappa} \|\nabla \theta\|, \quad (3.8)$$

$$\begin{aligned}
\|\nabla \vartheta_t\| &\leq \|\kappa'(\theta)\|_{L^\infty} \|\theta_t \nabla \theta\| + \|\kappa(\theta)\|_{L^\infty} \|\nabla \theta_t\| \\
&\leq C(\|\theta_t\|_{L^4} \|\nabla \theta\|_{\mathbf{L}^4} + \|\nabla \theta_t\|),
\end{aligned} \tag{3.9}$$

$$\begin{aligned}
\|\nabla^2 \vartheta\| &\leq \|\chi'(\vartheta)\|_{L^\infty} \|\nabla^2 \vartheta\| + \|\chi''(\vartheta)\|_{L^\infty} \|\nabla \vartheta\|_{\mathbf{L}^4}^2 \\
&\leq C(\|\nabla^2 \vartheta\| + \|\nabla \vartheta\|_{\mathbf{L}^4}^2),
\end{aligned} \tag{3.10}$$

$$\begin{aligned}
\|\nabla^2 \vartheta\| &\leq \|\kappa(\theta)\|_{L^\infty} \|\nabla^2 \theta\| + \|\kappa'(\theta)\|_{L^\infty} \|\nabla \theta\|_{\mathbf{L}^4}^2 \\
&\leq C(\|\nabla^2 \theta\| + \|\nabla \theta\|_{\mathbf{L}^4}^2),
\end{aligned} \tag{3.11}$$

$$\begin{aligned}
\|\nabla^3 \vartheta\| &\leq \|\chi'(\vartheta)\|_{L^\infty} \|\nabla^3 \vartheta\| + 3\|\chi''(\vartheta)\|_{L^\infty} \|\nabla^2 \vartheta\|_{\mathbf{L}^4} \|\nabla \vartheta\|_{\mathbf{L}^4} \\
&\quad + \|\chi'''(\vartheta)\|_{L^\infty} \|\nabla \vartheta\|_{\mathbf{L}^6}^3 \\
&\leq C(\|\nabla^3 \vartheta\| + \|\nabla^2 \vartheta\|_{\mathbf{L}^4} \|\nabla \vartheta\|_{\mathbf{L}^4} + \|\nabla \vartheta\|_{\mathbf{L}^6}^3),
\end{aligned} \tag{3.12}$$

$$\|\nabla^3 \vartheta\| \leq C(\|\nabla^3 \theta\| + \|\nabla^2 \theta\|_{\mathbf{L}^4} \|\nabla \theta\|_{\mathbf{L}^4} + \|\nabla \theta\|_{\mathbf{L}^6}^3), \tag{3.13}$$

where the constant C only depends on the domain Ω as well as the upper and lower bounds of the modified thermal diffusivity κ given in subsection 3.1.3 (recall also Remark 3.2).

The following elementary estimates on parabolic equation with convection will be useful in the subsequent proofs (we refer to [35, Section 4] for the case $n = 2$, while the case $n = 3$ can be proved in a similar way using the Sobolev embedding theorems in $3D$):

Lemma 3.5. *For $n = 2, 3$, consider the following parabolic problem*

$$\begin{cases} \vartheta_t + \mathbf{u} \cdot \nabla \vartheta - \tilde{\kappa}(\vartheta) \Delta \vartheta = 0, & (t, x) \in (0, T) \times \Omega, \\ \vartheta|_{\Gamma} = 0, & (t, x) \in (0, T) \times \Gamma, \\ \vartheta|_{t=0} = \vartheta_0, & x \in \Omega. \end{cases} \tag{3.14}$$

Suppose that $\tilde{\kappa}(\cdot)$ is a smooth function with positive upper and lower bounds $0 < \kappa_L \leq \tilde{\kappa}(s) \leq \kappa_U < +\infty$ for $s \in \mathbb{R}$, then the solution ϑ to problem (3.14) satisfies the following differential inequality

$$\frac{d}{dt} \|\nabla \vartheta\|^2 + \frac{1}{\kappa_U} \|\vartheta_t\|^2 \leq \begin{cases} C(1 + \|\mathbf{u}\|^2 \|\nabla \mathbf{u}\|^2) \|\nabla \vartheta\|^2, & \text{for } n = 2, \\ C(1 + \|\nabla \mathbf{u}\|^4) \|\nabla \vartheta\|^2, & \text{for } n = 3, \end{cases} \tag{3.15}$$

where the constant C depends on Ω, n, κ_U . Besides, it holds

$$\|\nabla^2 \vartheta\| \leq \begin{cases} C(\|\vartheta_t\| + \|\mathbf{u}\| \|\nabla \mathbf{u}\| \|\nabla \vartheta\|), & \text{for } n = 2, \\ C(\|\vartheta_t\| + \|\nabla \mathbf{u}\|^2 \|\nabla \vartheta\|), & \text{for } n = 3, \end{cases} \tag{3.16}$$

where the constant C depends on Ω, n, κ_L .

3.2 A priori estimates

In this section, we derive a specific differential inequality that will be crucial in obtaining higher-order estimates for the strong solutions to problem (1.3)–(1.8).

Inspired by [27], it is useful to introduce the following shifted temperature

$$\hat{\theta} = \theta - \theta_0, \tag{3.17}$$

which satisfies the following parabolic equation subject to homogeneous Dirichlet boundary condition and zero initial datum:

$$\begin{cases} \hat{\theta}_t + \mathbf{u} \cdot \nabla \hat{\theta} - \nabla \cdot (\kappa(\hat{\theta} + \theta_0) \nabla \hat{\theta}) = -\mathbf{u} \cdot \nabla \theta_0 + \nabla \cdot (\kappa(\hat{\theta} + \theta_0) \nabla \theta_0), \\ \hat{\theta}|_{\Gamma} = 0, \\ \hat{\theta}|_{t=0} = 0, \end{cases} \quad \begin{matrix} (t, x) \in (0, T) \times \Omega, \\ (t, x) \in (0, T) \times \Gamma, \\ x \in \Omega. \end{matrix} \quad (3.18)$$

Next, we define the functional

$$\begin{aligned} \mathcal{H}(t) = & \|\mathbf{u}\|^2 + \|\nabla \mathbf{u}\|^2 + 2 \int_{\Omega} \mu(\theta) |\mathcal{D}\mathbf{u}|^2 dx + a\lambda_0 \|\nabla \phi\|^2 + 2a\lambda_0 \int_{\Omega} W(\phi) dx \\ & + \|\Delta \phi - W'(\phi)\|^2 + \|\nabla \hat{\theta}\|^2 + \|\theta_t\|^2. \end{aligned} \quad (3.19)$$

Then we can deduce that

Lemma 3.6. *Suppose that $n = 2, 3$, $\theta_0 \in H^2(\Omega) \cap H_0^1(\Omega)$, $|\phi_0| \leq 1$ in Ω , $|\phi_b| \leq 1$ on Γ and $\phi_b \in H^{\frac{5}{2}}(\Gamma)$. Moreover, we assume that the non-constant viscosity $\mu(\cdot)$ and thermal diffusivity $\kappa(\cdot)$ are taken as in subsection 3.1.3 satisfying (3.3)-(3.4). Let $(\mathbf{u}, \phi, \theta)$ be a smooth solution to problem (1.3)-(1.8). Then the following differential inequality holds:*

$$\begin{aligned} & \frac{d}{dt} \mathcal{H}(t) + \|\mathbf{u}_t\|^2 + \gamma \|\nabla(\Delta \phi - W'(\phi))\|^2 + \underline{\kappa} \|\Delta \hat{\theta}\|^2 + \underline{\kappa} \|\nabla \theta_t\|^2 \\ & + [\underline{\mu} - 2\nu(\|\nabla \hat{\theta}(t)\|_{\mathbf{L}^4} + \|\nabla \theta_0\|_{\mathbf{L}^4})] \|\mathbf{S}\mathbf{u}\|^2 \\ \leq & C_1 (\|\nabla \hat{\theta}(t)\|_{\mathbf{L}^4} + \|\nabla \theta_0\|_{\mathbf{L}^4} + 1)^8 (\mathcal{H}(t) + 1)^3, \end{aligned} \quad (3.20)$$

where $\nu > 0$ is an arbitrary constant and the constant C_1 depends on ν , $\|\phi_0\|_{L^\infty}$, $\|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)}$, $\|\theta_0\|_{H^2}$, Ω , $\underline{\kappa}$, $\underline{\mu}$, γ and coefficients of the system.

Proof. For the sake of simplicity, in the remaining part of the proof we only treat the case $n = 3$. Similar result can be obtained for $n = 2$ with only minor modifications due to the Sobolev embedding theorems. It is important to note that we have assumed $\mu(\cdot)$, $\kappa(\cdot)$ are taken in such a way as in subsection 3.1.3 (see Remark 3.2). Moreover, in the subsequent proof of this lemma, we shall use Sobolev embedding theorem to control the L^∞ -norm of θ instead of the maximum principle Lemma 3.4, since the latter is not valid in the corresponding Galerkin approximate scheme (i.e., Type A in the Appendix).

The proof of Lemma 3.6 consists of several steps.

Step 1. Lower-order estimate for \mathbf{u} and ϕ . Multiplying equation (1.3) with \mathbf{u} and equation (1.5) with $-a\lambda_0(\Delta \phi - W'(\phi))$, respectively, integrating over Ω and adding the resultants together, we have

$$\begin{aligned} & \frac{1}{2} \frac{d}{dt} \left(\|\mathbf{u}\|^2 + a\lambda_0 \|\nabla \phi\|^2 + 2a\lambda_0 \int_{\Omega} W(\phi) dx \right) \\ & + 2 \int_{\Omega} \mu(\theta) |\mathcal{D}\mathbf{u}|^2 dx + a\lambda_0 \gamma \|\Delta \phi - W'(\phi)\|^2 \\ = & \int_{\Omega} [\lambda(\theta) \nabla \phi \otimes \nabla \phi] : \nabla \mathbf{u} dx + \int_{\Omega} \theta \mathbf{g} \cdot \mathbf{u} dx \\ & + a\lambda_0 \int_{\Omega} (\mathbf{u} \cdot \nabla \phi) (\Delta \phi - W'(\phi)) dx \\ := & J_1 + J_2 + J_3. \end{aligned} \quad (3.21)$$

By Poincaré's inequality, we easily get

$$\begin{aligned} J_2 &\leq |\mathbf{g}| \|\theta\| \|\mathbf{u}\| \leq c_P |\mathbf{g}| \|\theta\| \|\nabla \mathbf{u}\| \\ &\leq \frac{\mu}{4} \|\nabla \mathbf{u}\|^2 + \frac{c_P^2 |\mathbf{g}|^2}{\mu} \|\theta\|^2, \end{aligned} \quad (3.22)$$

where the constant c_P only depends on n, Ω . Next, using the identity

$$\nabla \cdot (\nabla \phi \otimes \nabla \phi) = \Delta \phi \nabla \phi + \nabla \left(\frac{|\nabla \phi|^2}{2} \right),$$

together with the Hölder inequality, Sobolev embedding theorem, Poincaré's inequality and Young's inequality, after integration by parts, we deduce that

$$\begin{aligned} &J_1 + J_3 \\ &= -a\lambda_0 \int_{\Omega} \mathbf{u} \cdot \nabla \left(\frac{|\nabla \phi|^2}{2} + W'(\phi) \right) dx - b\lambda_0 \int_{\Omega} \theta (\nabla \phi \otimes \nabla \phi) : \nabla \mathbf{u} dx \\ &\leq |b|\lambda_0 \|\theta\|_{L^\infty} \|\nabla \mathbf{u}\| \|\nabla \phi\|_{\mathbf{L}^4}^2 \\ &\leq \frac{\mu}{4} \|\nabla \mathbf{u}\|^2 + \frac{c|b|^2\lambda_0^2}{\mu} \|\nabla \theta\|_{\mathbf{L}^4}^2 \|\nabla \phi\|_{\mathbf{L}^4}^4 \\ &\leq \frac{\mu}{4} \|\nabla \mathbf{u}\|^2 + \frac{c|b|^2\lambda_0^2}{\mu} \|\nabla \theta\|_{\mathbf{L}^4}^2 \|\phi\|_{H^2}^2 \|\phi\|_{L^\infty}^2 \\ &\leq \frac{\mu}{4} \|\nabla \mathbf{u}\|^2 + \frac{c|b|^2\lambda_0^2}{\mu} \|\nabla \theta\|_{\mathbf{L}^4}^2 \|\phi\|_{L^\infty}^2 \\ &\quad \times \left(\|\Delta \phi - W'(\phi)\|^2 + \|W'(\phi)\|^2 + \|\phi\|^2 + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}^2 \right). \end{aligned} \quad (3.23)$$

In (3.23), we have used the fact $\|\theta\|_{L^\infty} \leq c\|\nabla \theta\|_{\mathbf{L}^4}$ for any $\theta \in H^2(\Omega) \cap H_0^1(\Omega)$ and the following estimate derived from the Gagliardo–Nirenberg inequality ($n = 3$)

$$\|\nabla \phi\|_{\mathbf{L}^4} \leq c\|\phi\|_{H^2}^{\frac{1}{2}} \|\phi\|_{L^\infty}^{\frac{1}{2}}, \quad \forall \phi \in H^2, \quad (3.24)$$

with the elliptic estimate $\|\phi\|_{H^2} \leq c(\|\Delta \phi\| + \|\phi\| + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)})$.

Hence, we can conclude from the estimates (3.22), (3.23), Lemma 3.3, Poincaré's inequality, the fact $2\|\mathcal{D}\mathbf{u}\|^2 = \|\nabla \mathbf{u}\|^2$ and the variable transformation (3.17) that

$$\begin{aligned} &\frac{1}{2} \frac{d}{dt} \left(\|\mathbf{u}\|^2 + a\lambda_0 \|\nabla \phi\|^2 + 2a\lambda_0 \int_{\Omega} W(\phi) dx \right) + \frac{\mu}{2} \|\nabla \mathbf{u}\|^2 \\ &\leq C \|\nabla \theta\|_{\mathbf{L}^4}^2 (\|\Delta \phi - W'(\phi)\|^2 + 1) + C \|\theta\|^2 \\ &\leq C (\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla \theta_0\|_{\mathbf{L}^4}^2) \|\Delta \phi - W'(\phi)\|^2 + C (\|\hat{\theta}\|^2 + \|\theta_0\|^2) \\ &\leq C (\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla \theta_0\|_{\mathbf{L}^4}^2) \|\Delta \phi - W'(\phi)\|^2 + C \|\nabla \hat{\theta}\|^2 + C. \end{aligned} \quad (3.25)$$

Step 2. \mathbf{H}^1 -estimate for \mathbf{u} . Since $\mathbf{u}_t \in \mathbf{H}$, it follows that $-(\Delta \mathbf{u}, \mathbf{u}_t) = (S\mathbf{u}, \mathbf{u}_t)$. Then multiplying equation (1.3) by $S\mathbf{u} = -\Delta \mathbf{u} + \nabla \pi$ and integrating over Ω , we get

$$\begin{aligned} &\frac{1}{2} \frac{d}{dt} \|\nabla \mathbf{u}\|^2 + \int_{\Omega} \mu(\theta) |S\mathbf{u}|^2 dx \\ &= - \int_{\Omega} (\mathbf{u} \cdot \nabla \mathbf{u}) \cdot S\mathbf{u} dx + 2 \int_{\Omega} \mu'(\theta) (\nabla \theta \cdot \mathcal{D}\mathbf{u}) \cdot S\mathbf{u} dx + \int_{\Omega} \mu(\theta) \nabla \pi \cdot S\mathbf{u} dx \end{aligned}$$

$$\begin{aligned}
& - \int_{\Omega} \{ \nabla \cdot [\lambda(\theta)(\nabla \phi \otimes \nabla \phi)] \} \cdot S \mathbf{u} dx + \int_{\Omega} \theta \mathbf{g} \cdot S \mathbf{u} dx \\
& = \sum_{m=1}^5 I_m.
\end{aligned} \tag{3.26}$$

In what follows, we denote by $\epsilon > 0$ a constant that can be chosen arbitrary small if necessary. Using the Hölder inequality, the Sobolev embedding theorem, (2.2), (3.17) and Young's inequality, the terms I_1, I_2, I_5 can be estimated as follows:

$$\begin{aligned}
I_1 & \leq c \|\mathbf{u}\|_{\mathbf{L}^6} \|\nabla \mathbf{u}\|_{\mathbf{L}^3} \|S \mathbf{u}\| \leq c \|\nabla \mathbf{u}\|^{\frac{3}{2}} \|S \mathbf{u}\|^{\frac{3}{2}} \\
& \leq \epsilon \|S \mathbf{u}\|^2 + C \|\nabla \mathbf{u}\|^6, \\
I_2 & \leq \|\mu'(\theta)\|_{L^\infty} \|\nabla \theta\|_{\mathbf{L}^4} \|\nabla \mathbf{u}\|_{\mathbf{L}^4} \|S \mathbf{u}\| \\
& \leq C \|\nabla \theta\|_{\mathbf{L}^4} \|\nabla \mathbf{u}\|^{\frac{1}{4}} \|\Delta \mathbf{u}\|^{\frac{3}{4}} \|S \mathbf{u}\| \\
& \leq C (\|\nabla \hat{\theta}\|_{\mathbf{L}^4} + \|\nabla \theta_0\|_{\mathbf{L}^4}) \|\nabla \mathbf{u}\|^{\frac{1}{4}} \|S \mathbf{u}\|^{\frac{7}{4}} \\
& \leq \epsilon \|S \mathbf{u}\|^2 + C (\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla \theta_0\|_{\mathbf{L}^4}^8) \|\nabla \mathbf{u}\|^2, \\
I_5 & \leq \epsilon \|S \mathbf{u}\|^2 + C \|\theta\|^2 \leq \epsilon \|S \mathbf{u}\|^2 + C \|\hat{\theta}\|^2 + C \|\theta_0\|^2 \\
& \leq \epsilon \|S \mathbf{u}\|^2 + C \|\nabla \hat{\theta}\|^2 + C.
\end{aligned}$$

Concerning the term I_3 , using integration by parts and the estimates (2.1), (2.2) for the pressure, we have

$$\begin{aligned}
I_3 & = - \int_{\Omega} \pi \mu'(\theta) \nabla \theta \cdot S \mathbf{u} dx \\
& \leq \|\mu'(\theta)\|_{L^\infty} \|\pi\|_{L^4} \|\nabla \theta\|_{\mathbf{L}^4} \|S \mathbf{u}\| \\
& \leq C \|\pi\|_{H^1}^{\frac{3}{4}} \|\pi\|^{\frac{1}{4}} \|\nabla \theta\|_{\mathbf{L}^4} \|S \mathbf{u}\| \\
& \leq C \|S \mathbf{u}\|^{\frac{3}{4}} (\nu \|S \mathbf{u}\| + C_\nu \|\nabla \mathbf{u}\|)^{\frac{1}{4}} (\|\nabla \hat{\theta}\|_{\mathbf{L}^4} + \|\nabla \theta_0\|_{\mathbf{L}^4}) \|S \mathbf{u}\| \\
& \leq \epsilon \|S \mathbf{u}\|^2 + \nu (\|\nabla \hat{\theta}\|_{\mathbf{L}^4} + \|\nabla \theta_0\|_{\mathbf{L}^4}) \|S \mathbf{u}\|^2 + C (\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla \theta_0\|_{\mathbf{L}^4}^8) \|\nabla \mathbf{u}\|^2,
\end{aligned}$$

where the constant $\nu > 0$ is arbitrary and in particular, it is independent of ϵ .

Next, for I_4 , we have

$$\begin{aligned}
I_4 & \leq \|\nabla \cdot [\lambda(\theta) \nabla \phi \otimes \nabla \phi]\| \|S \mathbf{u}\| \\
& \leq \epsilon \|S \mathbf{u}\|^2 + C \|\nabla \cdot [\lambda(\theta) \nabla \phi \otimes \nabla \phi]\|^2 \\
& \leq \epsilon \|S \mathbf{u}\|^2 + C \|\lambda'(\theta)\|_{L^\infty}^2 \|\nabla \theta\|_{\mathbf{L}^4}^2 \|\nabla \phi\|_{\mathbf{L}^8}^4 \\
& \quad + C \|\lambda(\theta)\|_{L^\infty}^2 (\|\Delta \phi\|^2 + \|\nabla^2 \phi\|^2) \|\nabla \phi\|_{\mathbf{L}^\infty}^2 \\
& := \epsilon \|S \mathbf{u}\|^2 + I_{4a} + I_{4b}.
\end{aligned}$$

It follows from the Gagliardo–Nirenberg inequality, Lemma 3.3 and Young's inequality that

$$\begin{aligned}
I_{4a} & \leq C \|\nabla \theta\|_{\mathbf{L}^4}^2 \|\nabla \phi\|_{\mathbf{L}^6}^{\frac{7}{2}} \|\nabla \phi\|_{\mathbf{H}^2}^{\frac{1}{2}} \\
& \leq C (\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla \theta_0\|_{\mathbf{L}^4}^2) (\|\Delta \phi\| + \|\phi\| + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)})^{\frac{7}{2}} \\
& \quad \times (\|\Delta \phi\|_{H^1} + \|\phi\| + \|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)})^{\frac{1}{2}}
\end{aligned}$$

$$\begin{aligned}
&\leq C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla\theta_0\|_{\mathbf{L}^4}^2)(\|\Delta\phi - W'(\phi)\| + C)^{\frac{7}{2}} \\
&\quad \times (\|\nabla(\Delta\phi - W'(\phi))\| + \|\Delta\phi - W'(\phi)\| + \|W''(\phi)\nabla\phi\| + \|W'(\phi)\| + C)^{\frac{1}{2}} \\
&\leq \epsilon\|\nabla(\Delta\phi - W'(\phi))\|^2 + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla\theta_0\|_{\mathbf{L}^4}^2)^{\frac{4}{3}}(\|\Delta\phi - W'(\phi)\|^{\frac{14}{3}} + C) \\
&\quad + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla\theta_0\|_{\mathbf{L}^4}^2)(\|\Delta\phi - W'(\phi)\|^4 + \|\nabla\phi\|^4 + C) \\
&\leq \epsilon\|\nabla(\Delta\phi - W'(\phi))\|^2 + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla\theta_0\|_{\mathbf{L}^4}^4)(\|\Delta\phi - W'(\phi)\|^6 + \|\nabla\phi\|^6) \\
&\quad + C(\|\Delta\phi - W'(\phi)\|^2 + \|\nabla\phi\|^2) + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla\theta_0\|_{\mathbf{L}^4}^4 + 1),
\end{aligned}$$

and

$$\begin{aligned}
I_{4b} &\leq C(1 + \|\theta\|_{L^\infty}^2)(\|\Delta\phi\|^2 + \|\nabla^2\phi\|^2)\|\nabla\phi\|_{\mathbf{H}^2}\|\nabla\phi\|_{\mathbf{H}^1} \\
&\leq C(1 + \|\hat{\theta}\|_{L^\infty}^2 + \|\theta_0\|_{L^\infty}^2)\|\phi\|_{H^2}^3\|\phi\|_{H^3} \\
&\leq C(1 + \|\nabla\hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla\theta_0\|_{\mathbf{L}^4}^2)(\|\Delta\phi - W'(\phi)\|^3 + C)\left(\|\nabla(\Delta\phi - W'(\phi))\| \right. \\
&\quad \left. + \|\Delta\phi - W'(\phi)\| + \|W''(\phi)\nabla\phi\| + \|W'(\phi)\| + \|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)} + \|\phi\|\right) \\
&\leq \epsilon\|\nabla(\Delta\phi - W'(\phi))\|^2 + C(1 + \|\nabla\hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla\theta_0\|_{\mathbf{L}^4}^4)(\|\Delta\phi - W'(\phi)\|^6 + 1) \\
&\quad + C(1 + \|\nabla\hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla\theta_0\|_{\mathbf{L}^4}^2)(\|\Delta\phi - W'(\phi)\|^4 + \|\nabla\phi\|^4 + 1) \\
&\leq \epsilon\|\nabla(\Delta\phi - W'(\phi))\|^2 + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla\theta_0\|_{\mathbf{L}^4}^4)(\|\Delta\phi - W'(\phi)\|^6 + \|\nabla\phi\|^6) \\
&\quad + C(\|\Delta\phi - W'(\phi)\|^6 + \|\nabla\phi\|^6) + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla\theta_0\|_{\mathbf{L}^4}^4 + 1).
\end{aligned}$$

As a result, we deduce from (3.26), the above estimates and a further application of Young's inequality that

$$\begin{aligned}
&\frac{1}{2}\frac{d}{dt}\|\nabla\mathbf{u}\|^2 + \left[\underline{\mu} - 5\epsilon - \nu(\|\nabla\hat{\theta}\|_{\mathbf{L}^4} + \|\nabla\theta_0\|_{\mathbf{L}^4})\right]\|S\mathbf{u}\|^2 \\
&\leq 2\epsilon\|\nabla(\Delta\phi - W'(\phi))\|^2 \\
&\quad + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla\theta_0\|_{\mathbf{L}^4}^8)(\|\nabla\mathbf{u}\|^2 + \|\Delta\phi - W'(\phi)\|^6 + \|\nabla\phi\|^6) \\
&\quad + C(\|\nabla\mathbf{u}\|^6 + \|\Delta\phi - W'(\phi)\|^6 + \|\nabla\phi\|^6 + \|\nabla\hat{\theta}\|^2) \\
&\quad + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla\theta_0\|_{\mathbf{L}^4}^4 + 1). \tag{3.27}
\end{aligned}$$

On the other hand, multiplying the equation (1.3) by \mathbf{u}_t and integrating over Ω , we obtain that

$$\begin{aligned}
&\frac{d}{dt}\int_{\Omega}\mu(\theta)|\mathcal{D}\mathbf{u}|^2dx + \|\mathbf{u}_t\|^2 \\
&= -\int_{\Omega}(\mathbf{u} \cdot \nabla\mathbf{u}) \cdot \mathbf{u}_tdx + \int_{\Omega}\mu'(\theta)\theta_t|\mathcal{D}\mathbf{u}|^2dx \\
&\quad - \int_{\Omega}\nabla \cdot [\lambda(\theta)(\nabla\phi \otimes \nabla\phi)] \cdot \mathbf{u}_tdx + \int_{\Omega}\theta\mathbf{g} \cdot \mathbf{u}_tdx \\
&= \sum_{m=1}^4 K_m. \tag{3.28}
\end{aligned}$$

The terms K_1, K_2, K_4 on the right-hand side of (3.28) can be estimated as follows:

$$\begin{aligned}
K_1 &\leq \|\mathbf{u}_t\| \|\mathbf{u}\|_{\mathbf{L}^6} \|\nabla\mathbf{u}\|_{\mathbf{L}^3} \\
&\leq c\|\mathbf{u}_t\| \|\nabla\mathbf{u}\|^{\frac{3}{2}} \|\nabla\mathbf{u}\|_{\mathbf{H}^1}^{\frac{1}{2}} \\
&\leq \epsilon\|\mathbf{u}_t\|^2 + \epsilon\|S\mathbf{u}\|^2 + C\|\nabla\mathbf{u}\|^6,
\end{aligned}$$

$$\begin{aligned}
K_2 &\leq c\|\mu'(\theta)\|_{L^\infty}\|\theta_t\|\|\mathcal{D}\mathbf{u}\|_{\mathbf{L}^4}^2 \\
&\leq C\|\theta_t\|\|\nabla\mathbf{u}\|^{\frac{1}{2}}\|\nabla\mathbf{u}\|_{\mathbf{H}^1}^{\frac{3}{2}} \\
&\leq \epsilon\|S\mathbf{u}\|^2 + C(\|\nabla\mathbf{u}\|^6 + \|\theta_t\|^6),
\end{aligned}$$

$$\begin{aligned}
K_4 &\leq C\|\theta\|\|\mathbf{u}_t\| \\
&\leq \epsilon\|\mathbf{u}_t\|^2 + C(\|\hat{\theta}\|^2 + \|\theta_0\|^2) \\
&\leq \epsilon\|\mathbf{u}_t\|^2 + C(\|\nabla\hat{\theta}\|^2 + 1).
\end{aligned}$$

For the third term K_3 , we have

$$\begin{aligned}
K_3 &\leq \|\nabla \cdot (\lambda(\theta)\nabla\phi \otimes \nabla\phi)\|\|\mathbf{u}_t\| \\
&\leq \epsilon\|\mathbf{u}_t\|^2 + C\|\nabla \cdot (\lambda(\theta)\nabla\phi \otimes \nabla\phi)\|^2,
\end{aligned} \tag{3.29}$$

where the last term on the right-hand side of (3.29) can be estimated exactly as I_{4a} and I_{4b} above. Then we infer from (3.28), the above estimates and Young's inequality that

$$\begin{aligned}
&\frac{d}{dt} \int_{\Omega} \mu(\theta)|\mathcal{D}\mathbf{u}|^2 dx + (1 - 3\epsilon)\|\mathbf{u}_t\|^2 \\
&\leq 2\epsilon\|S\mathbf{u}\|^2 + 2\epsilon\|\nabla(\Delta\phi - W'(\phi))\|^2 \\
&\quad + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla\theta_0\|_{\mathbf{L}^4}^8)(\|\Delta\phi - W'(\phi)\|^6 + \|\nabla\phi\|^6) \\
&\quad + C(\|\nabla\mathbf{u}\|^6 + \|\theta_t\|^6 + \|\Delta\phi - W'(\phi)\|^6 + \|\nabla\phi\|^6 + \|\nabla\hat{\theta}\|^2) \\
&\quad + C(\|\nabla\hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla\theta_0\|_{\mathbf{L}^4}^4 + 1).
\end{aligned} \tag{3.30}$$

Step 3. H^2 -estimate for ϕ . Due to equation (1.5) and the boundary conditions (1.7), it holds $\Delta\phi - W'(\phi)|_{\Gamma} = 0$ (similar situation can be found in [22] for the liquid crystal system). Then we can compute that

$$\begin{aligned}
&\frac{1}{2} \frac{d}{dt} \|\Delta\phi - W'(\phi)\|^2 + \gamma \|\nabla(\Delta\phi - W'(\phi))\|^2 \\
&= -\gamma \int_{\Omega} W''(\phi)|\Delta\phi - W'(\phi)|^2 dx - 2 \int_{\Omega} (\Delta\phi - W'(\phi))\nabla\mathbf{u} : \nabla^2\phi dx \\
&\quad - \int_{\Omega} (\Delta\mathbf{u} \cdot \nabla\phi)(\Delta\phi - W'(\phi)) dx \\
&= \sum_{m=5}^7 K_m.
\end{aligned} \tag{3.31}$$

The first term K_5 can be simply estimated by using Lemma 3.3

$$K_5 \leq \gamma\|W''(\phi)\|_{L^\infty}\|\Delta\phi - W'(\phi)\|^2 \leq C\|\Delta\phi - W'(\phi)\|^2.$$

Then for terms K_6 and K_7 , it follows from the Hölder inequality, Gagliardo–Nirenberg inequality, Poincaré's inequality and Young's inequality that

$$\begin{aligned}
K_6 &\leq C\|\Delta\phi - W'(\phi)\|_{L^6}\|\nabla\mathbf{u}\|_{\mathbf{L}^3}\|\phi\|_{H^2} \\
&\leq C\|\nabla(\Delta\phi - W'(\phi))\|\|\nabla\mathbf{u}\|^{\frac{1}{2}}\|\nabla\mathbf{u}\|_{\mathbf{H}^1}^{\frac{1}{2}}(\|\Delta\phi\| + \|\phi\| + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}) \\
&\leq \epsilon\|\nabla(\Delta\phi - W'(\phi))\|^2 + C\|\nabla\mathbf{u}\|\|\Delta\mathbf{u}\|(\|\Delta\phi - W'(\phi)\|^2 + \|W'(\phi)\|^2 + 1) \\
&\leq \epsilon\|\nabla(\Delta\phi - W'(\phi))\|^2 + \epsilon\|S\mathbf{u}\|^2 + C(\|\nabla\mathbf{u}\|^2 + \|\nabla\mathbf{u}\|^6 + \|\Delta\phi - W'(\phi)\|^6),
\end{aligned}$$

$$\begin{aligned}
K_7 &\leq \|\Delta \mathbf{u}\| \|\nabla \phi\|_{\mathbf{L}^6} \|\Delta \phi - W'(\phi)\|_{L^3} \\
&\leq \epsilon \|\mathbf{S}\mathbf{u}\|^2 + C \|\phi\|_{H^2}^2 \|\nabla(\Delta \phi - W'(\phi))\| \|\Delta \phi - W'(\phi)\| \\
&\leq \epsilon \|\mathbf{S}\mathbf{u}\|^2 + \epsilon \|\nabla(\Delta \phi - W'(\phi))\|^2 \\
&\quad + C(\|\Delta \phi - W'(\phi)\|^6 + \|\Delta \phi - W'(\phi)\|^2).
\end{aligned}$$

As a result, we infer from (3.31) and the above estimates that

$$\begin{aligned}
&\frac{1}{2} \frac{d}{dt} \|\Delta \phi - W'(\phi)\|^2 + (\gamma - 2\epsilon) \|\nabla(\Delta \phi - W'(\phi))\|^2 \\
&\leq 2\epsilon \|\mathbf{S}\mathbf{u}\|^2 + C(\|\nabla \mathbf{u}\|^6 + \|\Delta \phi - W'(\phi)\|^6) + C.
\end{aligned} \tag{3.32}$$

Step 4. H^1 -estimate for θ . We shall estimate H^1 -norm of the shifted temperature $\hat{\theta}$ instead of the original one θ . Multiplying the equation in (3.18) for $\hat{\theta}$ by $-\Delta \hat{\theta}$, integrating over Ω , we have

$$\begin{aligned}
&\frac{1}{2} \frac{d}{dt} \|\nabla \hat{\theta}\|^2 + \int_{\Omega} \kappa(\hat{\theta} + \theta_0) |\Delta \hat{\theta}|^2 dx \\
&= \int_{\Omega} (\mathbf{u} \cdot \nabla)(\hat{\theta} + \theta_0) \Delta \hat{\theta} dx - \int_{\Omega} \kappa(\hat{\theta} + \theta_0) \Delta \theta_0 \Delta \hat{\theta} dx \\
&\quad - \int_{\Omega} \kappa'(\hat{\theta} + \theta_0) |\nabla(\hat{\theta} + \theta_0)|^2 \Delta \hat{\theta} dx \\
&:= \sum_{m=8}^{10} K_m.
\end{aligned} \tag{3.33}$$

Using the Hölder inequality, the Sobolev embedding theorem and Young's inequality, we obtain that

$$\begin{aligned}
K_8 &\leq \|\mathbf{u}\|_{\mathbf{L}^4} \|\nabla(\hat{\theta} + \theta_0)\|_{\mathbf{L}^4} \|\Delta \hat{\theta}\| \\
&\leq C \|\nabla \mathbf{u}\| (\|\nabla \hat{\theta}\|_{\mathbf{L}^4} + \|\nabla \theta_0\|_{\mathbf{L}^4}) \|\Delta \hat{\theta}\| \\
&\leq \epsilon \|\Delta \hat{\theta}\|^2 + C \|\nabla \mathbf{u}\|^4 + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla \theta_0\|_{\mathbf{L}^4}^4),
\end{aligned}$$

$$\begin{aligned}
K_9 &\leq \|\kappa(\hat{\theta} + \theta_0)\|_{L^\infty} \|\Delta \theta_0\| \|\Delta \hat{\theta}\| \\
&\leq \epsilon \|\Delta \hat{\theta}\|^2 + C,
\end{aligned}$$

$$\begin{aligned}
K_{10} &\leq \|\kappa'(\hat{\theta} + \theta_0)\|_{L^\infty} \|\nabla(\hat{\theta} + \theta_0)\|_{\mathbf{L}^4}^2 \|\Delta \hat{\theta}\| \\
&\leq \epsilon \|\Delta \hat{\theta}\|^2 + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla \theta_0\|_{\mathbf{L}^4}^4).
\end{aligned}$$

Thus, we infer from (3.33) and the above estimates that

$$\frac{1}{2} \frac{d}{dt} \|\nabla \hat{\theta}\|^2 + (\underline{\kappa} - 3\epsilon) \|\Delta \hat{\theta}\|^2 \leq C \|\nabla \mathbf{u}\|^4 + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla \theta_0\|_{\mathbf{L}^4}^4 + 1). \tag{3.34}$$

Step 5. L^2 -estimate for θ_t . Differentiating equation (1.6) for θ with respect to time, multiplying the resultant by θ_t and integrating over Ω , we obtain

$$\begin{aligned}
&\frac{1}{2} \frac{d}{dt} \|\theta_t\|^2 + \int_{\Omega} \kappa(\theta) |\nabla \theta_t|^2 dx \\
&= - \int_{\Omega} \kappa'(\theta) \theta_t \nabla \theta \cdot \nabla \theta_t dx - \int_{\Omega} (\mathbf{u}_t \cdot \nabla \theta) \theta_t dx - \int_{\Omega} (\mathbf{u} \cdot \nabla \theta_t) \theta_t dx
\end{aligned}$$

$$:= \sum_{m=11}^{13} K_m. \quad (3.35)$$

Thanks to the incompressibility of \mathbf{u} , it is obvious that $K_{13} = 0$. Next, we estimate the terms K_{12}, K_{13} by using the Sobolev embedding theorem:

$$\begin{aligned} K_{11} &\leq \|\kappa'(\theta)\|_{L^\infty} \|\theta_t\|_{L^4} \|\nabla \theta\|_{\mathbf{L}^4} \|\nabla \theta_t\| \\ &\leq C \|\nabla \theta\|_{\mathbf{L}^4} \|\theta_t\|^{\frac{1}{4}} \|\nabla \theta_t\|^{\frac{7}{4}} \\ &\leq \epsilon \|\nabla \theta_t\|^2 + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla \theta_0\|_{\mathbf{L}^4}^8) \|\theta_t\|^2, \\ K_{12} &\leq \|\mathbf{u}_t\| \|\nabla \theta\|_{\mathbf{L}^4} \|\theta_t\|_{L^4} \\ &\leq \epsilon \|\mathbf{u}_t\|^2 + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^2 + \|\nabla \theta_0\|_{\mathbf{L}^4}^2) \|\nabla \theta_t\|^{\frac{3}{2}} \|\theta_t\|^{\frac{1}{2}} \\ &\leq \epsilon \|\mathbf{u}_t\|^2 + \epsilon \|\nabla \theta_t\|^2 + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla \theta_0\|_{\mathbf{L}^4}^8) \|\theta_t\|^2. \end{aligned}$$

The above estimates together with Young's inequality yield that

$$\frac{1}{2} \frac{d}{dt} \|\theta_t\|^2 + (\underline{\kappa} - 2\epsilon) \|\nabla \theta_t\|^2 \leq \epsilon \|\mathbf{u}_t\|^2 + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla \theta_0\|_{\mathbf{L}^4}^8) \|\theta_t\|^2. \quad (3.36)$$

Step 6. Combing the differential inequalities (3.25), (3.27), (3.30), (3.32), (3.34) and (3.36), using Young's inequality and taking the coefficient $\epsilon > 0$ sufficiently small in all these inequalities such that

$$0 < \epsilon < \frac{1}{18} \min\{\underline{\mu}, \underline{\kappa}, \gamma, 1\}, \quad (3.37)$$

then we can conclude

$$\begin{aligned} &\frac{d}{dt} \mathcal{H}(t) + \underline{\mu} \|\nabla \mathbf{u}\|^2 + \|\mathbf{u}_t\|^2 + \gamma \|\nabla(\Delta \phi - W'(\phi))\|^2 + \underline{\kappa} \|\Delta \hat{\theta}\|^2 + \underline{\kappa} \|\nabla \theta_t\|^2 \\ &\quad + \left[\underline{\mu} - 2\nu(\|\nabla \hat{\theta}\|_{\mathbf{L}^4} + \|\nabla \theta_0\|_{\mathbf{L}^4}) \right] \|S\mathbf{u}\|^2 \\ &\leq C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla \theta_0\|_{\mathbf{L}^4}^8) (\|\nabla \mathbf{u}\|^2 + \|\Delta \phi - W'(\phi)\|^6 + \|\nabla \phi\|^6 + \|\theta_t\|^2) \\ &\quad + C(\|\nabla \mathbf{u}\|^6 + \|\Delta \phi - W'(\phi)\|^6 + \|\nabla \phi\|^6 + \|\theta_t\|^6 + \|\nabla \hat{\theta}\|^2) \\ &\quad + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^4 + \|\nabla \theta_0\|_{\mathbf{L}^4}^4 + 1) \\ &\leq C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla \theta_0\|_{\mathbf{L}^4}^8 + 1) (\|\nabla \mathbf{u}\|^6 + \|\Delta \phi - W'(\phi)\|^6 + \|\nabla \phi\|^6 + \|\theta_t\|^6 + \|\nabla \hat{\theta}\|^6) \\ &\quad + C(\|\nabla \hat{\theta}\|_{\mathbf{L}^4}^8 + \|\nabla \theta_0\|_{\mathbf{L}^4}^8 + 1), \end{aligned}$$

where $\mathcal{H}(t)$ is given in (3.19). By the definition of $\mathcal{H}(t)$, we easily arrive at our conclusion (3.20). The proof is complete. \square

3.3 Proof of Theorem 2.1

3.3.1 Existence

Existence of local strong solutions can be proved by means of a suitable semi-Galerkin approximate scheme (for instance, Type A in the Appendix section), which preserves the maximum principle for the phase function ϕ (see, e.g., [7, 22] for a similar argument for the liquid crystal system), but not for the temperature θ .

Step 1. The auxiliary problem. First, we consider the auxiliary initial boundary value problem (IBVP for short) of problem (1.3)–(1.8), in which the viscosity μ and the thermal diffusivity κ have been modified as in subsection 3.1.3 (see Remark 3.2).

For each $m \in \mathbb{N}$, we can construct an approximate solution $(\mathbf{u}^m, \phi^m, \theta^m)$ on certain time interval $[0, T_m]$ (see Proposition 6.1 in Appendix). On the other hand, the (formal) differential inequality (3.20) obtained in Lemma 3.6 can be justified by this approximate scheme. Therefore, we are able to apply (3.20) to derive uniform *a priori* estimates for the approximate solutions (and we drop the superscript m below for the sake of simplicity).

Since $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{V} \times H^2(\Omega) \times (H^2(\Omega) \cap H_0^1(\Omega))$, it is straightforward to verify that

$$\mathcal{H}(0) \leq C_0(\|\mathbf{u}_0\|_{\mathbf{V}}, \|\phi_0\|_{H^2}, \|\theta_0\|_{H^2}) := C_0 < +\infty.$$

It follows from the definition of $\hat{\theta}$ that $\hat{\theta}(0) = 0$ and as a result, we have $\|\nabla \hat{\theta}(0)\|_{\mathbf{L}^4} = 0$. Then in the differential inequality (3.20), we choose the positive constant ν as follows

$$\nu = \frac{\underline{\mu}}{4(\|\nabla \theta_0\|_{\mathbf{L}^4} + 1)}, \quad (3.38)$$

where $\underline{\mu}$ is taken as in subsection 3.1.3 (recall also Remark 3.2). As a consequence, the constant C_1 on the right-hand side of (3.20) is now fixed after we set the value of ν .

In (3.34), taking $\epsilon > 0$ sufficiently small (recall (3.37)), we get

$$\|\nabla \hat{\theta}(t)\|^2 \leq C \int_0^t (\|\nabla \mathbf{u}(\tau)\|^4 + \|\nabla \hat{\theta}(\tau)\|_{\mathbf{L}^4}^4) d\tau + Ct, \quad (3.39)$$

where C is independent of t . On the other hand, it follows from (3.18) that

$$\|\Delta \hat{\theta}(t)\| \leq C\|\theta_t(t)\| + C\|\nabla \mathbf{u}(t)\|^2 + C\|\nabla \hat{\theta}(t)\|_{\mathbf{L}^4}^2 + C, \quad (3.40)$$

where C may depend on $\underline{\kappa}$ (as taken in subsection 3.1.3), $\|\theta_0\|_{H^2}$ and Ω . Then by the Gagliardo–Nirenberg inequality we infer that (using the fact $\hat{\theta}|_{\Gamma} = 0$)

$$\begin{aligned} & \|\nabla \hat{\theta}(t)\|_{\mathbf{L}^4} \\ & \leq c \|\nabla \hat{\theta}(t)\|_{\mathbf{L}^4}^{\frac{1}{4}} \|\Delta \hat{\theta}(t)\|_{\mathbf{L}^4}^{\frac{3}{4}} \\ & \leq C_2 \left[\int_0^t (\mathcal{H}(\tau)^2 + \|\nabla \hat{\theta}(\tau)\|_{\mathbf{L}^4}^4) d\tau + t \right]^{\frac{1}{8}} \left(\mathcal{H}(t)^2 + \|\nabla \hat{\theta}(t)\|_{\mathbf{L}^4}^4 + 1 \right)^{\frac{3}{8}}. \end{aligned} \quad (3.41)$$

Now our aim is to prove that there exists a time $T_* > 0$ such that

$$\|\nabla \hat{\theta}(t)\|_{\mathbf{L}^4} < 1, \quad \forall t \in [0, T_*]. \quad (3.42)$$

Since $\|\nabla \hat{\theta}(0)\|_{\mathbf{L}^4} = 0$, then by continuity, the inequality (3.42) at least holds for sufficiently small time t . First, it is easy to find a sufficiently small time $T^* \in (0, 1]$ that the following inequalities are satisfied

$$4C_1(\|\nabla \theta_0\|_{\mathbf{L}^4} + 2)^8 (C_0 + 1)^2 T^* \leq \frac{1}{2} \ln \left(\frac{3}{2} \right), \quad (3.43)$$

$$C_2 (4C_0^2 + 4C_0 + 3)^{\frac{1}{2}} (T^*)^{\frac{1}{8}} \leq \frac{1}{2}. \quad (3.44)$$

Below we shall show that this time T^* is exactly what we are looking for. The proof is done by a contradiction argument in the spirit of [27]. Suppose that there is a $T_0 \in (0, T^*)$ satisfying

$$\|\nabla \hat{\theta}(t)\|_{\mathbf{L}^4} < 1 \quad \text{for } t \in [0, T_0), \quad \text{but } \|\nabla \hat{\theta}(T_0)\|_{\mathbf{L}^4} = 1. \quad (3.45)$$

It follows from (3.20), (3.38) and assumption (3.45) that for $t \in [0, T_0]$, it holds

$$\begin{aligned} & \frac{d}{dt} (\mathcal{H}(t) + 1) + \frac{\mu}{2} \|S\mathbf{u}\|^2 + \|\mathbf{u}_t\|^2 + \gamma \|\nabla(\Delta\phi - W'(\phi))\|^2 \\ & \quad + \underline{\kappa} \|\Delta\hat{\theta}\|^2 + \underline{\kappa} \|\nabla\theta_t\|^2 \\ & \leq C_1 (\|\nabla\theta_0\|_{\mathbf{L}^4} + 2)^8 (\mathcal{H}(t) + 1)^3. \end{aligned} \quad (3.46)$$

Recall the following inequality (see [27, Lemma 3.2]):

Lemma 3.7. *Let $\varphi(t)$ and $\psi(t)$ be nonnegative functions satisfying*

$$\begin{cases} \varphi'(t) + \psi(t) \leq C_* \varphi(t)^3 + h(t)\varphi(t) + f(t), & t \in (0, T], \\ \varphi(t) = \varphi_0 \geq 0, \end{cases}$$

where $h(\cdot)$ and $f(\cdot)$ are nonnegative continuous functions. Let $T_1 \in (0, T]$ and

$$C_* \int_0^{T_1} \left(2\varphi_0 + 2 \int_0^s f(\tau) d\tau \right)^2 ds + \int_0^{T_1} h(s) ds \leq \frac{1}{2} \ln \left(\frac{3}{2} \right).$$

Then, for all $t \in [0, T_1]$, the following inequality holds

$$\varphi(t) + \int_0^t \psi(s) ds \leq 2 \left(\varphi_0 + \int_0^t f(s) ds \right).$$

Let us now take

$$\begin{aligned} \varphi(t) &= \mathcal{H}(t) + 1 \quad \text{with} \quad \varphi(0) = \mathcal{H}(0) + 1 = C_0 + 1, \\ \psi(t) &= \frac{\mu}{2} \|S\mathbf{u}\|^2 + \|\mathbf{u}_t\|^2 + \gamma \|\nabla(\Delta\phi - W'(\phi))\|^2 + \underline{\kappa} \|\Delta\hat{\theta}\|^2 + \underline{\kappa} \|\nabla\theta_t\|^2, \\ C_* &= C_1 (\|\nabla\theta_0\|_{\mathbf{L}^4} + 2)^8, \\ f(t) &= 0, \\ h(t) &= 0. \end{aligned}$$

Then by (3.43), we can verify that all the assumptions in Lemma 3.7 are fulfilled on $[0, T_0] \subset [0, T^*]$ and as a consequence, it holds

$$\mathcal{H}(t) \leq 2C_0 + 1, \quad \forall t \in [0, T_0]. \quad (3.47)$$

Hence, we deduce from (3.41), (3.44), (3.45) and (3.47) that

$$\begin{aligned} & \|\nabla\hat{\theta}(T_0)\|_{\mathbf{L}^4} \\ & \leq C_2 \left(\int_0^{T_0} [\mathcal{H}(\tau)^2 + \|\nabla\hat{\theta}(\tau)\|_{\mathbf{L}^4}^4] d\tau + T_0 \right)^{\frac{1}{8}} \left(\mathcal{H}(T_0)^2 + \|\nabla\hat{\theta}(T_0)\|_{\mathbf{L}^4}^4 + 1 \right)^{\frac{3}{8}} \\ & \leq C_2 [(4C_0^2 + 4C_0 + 3)T_0]^{\frac{1}{8}} (4C_0^2 + 4C_0 + 3)^{\frac{3}{8}} \\ & < C_2 (4C_0^2 + 4C_0 + 3)^{\frac{1}{2}} (T^*)^{\frac{1}{8}} \\ & \leq \frac{1}{2} < 1, \end{aligned}$$

which leads to a contradiction with the definition of T_0 given in (3.45).

As a result, for the time T^* we have chosen above, (3.42) is satisfied and the differential inequality (3.46) holds on $[0, T^*]$. Then it follows from Lemma 3.7 that $\mathcal{H}(t) \leq 2C_0 + 1$ for

all $t \in [0, T^*]$. Using Lemma 3.3, the definition of $\mathcal{H}(t)$ (see (3.19)), (3.40), (3.42) and the elliptic estimate for ϕ , we can deduce that

$$\|\mathbf{u}(t)\|_{\mathbf{H}^1} + \|\phi(t)\|_{H^2} + \|\hat{\theta}(t)\|_{H^2} + \|\theta_t(t)\| \leq C(T^*), \quad \forall t \in [0, T^*], \quad (3.48)$$

$$\int_0^{T^*} (\|\mathbf{u}(t)\|_{\mathbf{H}^2}^2 + \|\phi(t)\|_{H^3}^2 + \|\mathbf{u}_t(t)\|^2 + \|\theta_t(t)\|_{H^1}^2) dt \leq C(T^*). \quad (3.49)$$

It follows from equation (1.5) and the above estimates that

$$\begin{aligned} \|\phi_t(t)\| &\leq \|\mathbf{u}(t)\|_{\mathbf{L}^3} \|\nabla \phi(t)\|_{\mathbf{L}^6} + \gamma \|\Delta \phi(t) - W'(\phi(t))\| \\ &\leq C \sup_{t \in [0, T^*]} \left(\|\mathbf{u}(t)\|_{\mathbf{H}^1} \|\phi(t)\|_{H^2} + \gamma \mathcal{H}(t)^{\frac{1}{2}} \right) \\ &\leq C(T^*), \quad \forall t \in [0, T^*], \end{aligned}$$

and

$$\begin{aligned} &\int_0^{T^*} \|\nabla \phi_t(t)\|^2 dt \\ &\leq 2 \int_0^{T^*} \|\nabla(\mathbf{u} \cdot \nabla \phi)\|^2 dt + 2\gamma^2 \int_0^{T^*} \|\nabla(\Delta \phi - W'(\phi))\|^2 dt \\ &\leq C \int_0^{T^*} (\|\nabla \mathbf{u}\|_{\mathbf{L}^3}^2 \|\nabla \phi\|_{\mathbf{L}^6}^2 + \|\mathbf{u}\|_{\mathbf{L}^3}^2 \|\nabla^2 \phi\|_{\mathbf{L}^6}^2) dt + C(T^*) \\ &\leq C \sup_{t \in [0, T^*]} \|\phi(t)\|_{H^2}^2 \int_0^{T^*} \|\nabla \mathbf{u}(t)\|_{\mathbf{H}^1}^2 dt \\ &\quad + C \sup_{t \in [0, T^*]} \|\mathbf{u}(t)\|_{\mathbf{H}^1}^2 \int_0^{T^*} \|\phi(t)\|_{H^3}^2 dt + C(T^*) \\ &\leq C(T^*), \end{aligned}$$

which yield the estimates for $\|\phi_t\|_{L^\infty(0, T^*; L^2(\Omega))}$ and $\|\phi_t\|_{L^2(0, T^*; H^1(\Omega))}$.

For every $m \in \mathbb{N}$, the approximate solution $(\mathbf{u}^m, \phi^m, \theta^m)$ constructed in the semi-Galerkin scheme (Type A in Appendix) fulfills the above estimates that are independent of the approximate parameter m on the uniform time interval $[0, T^*]$. Thus, the approximate solution $(\mathbf{u}^m, \phi^m, \theta^m)$ can be extended from $[0, T_m]$ to $[0, T^*]$. Then one can apply the classical compactness argument to pass to the limit as $m \rightarrow +\infty$ and prove the existence of a local strong solution $(\mathbf{u}, \phi, \theta)$ to the *auxiliary* IBVP of problem (1.3)–(1.8) (keeping subsection 3.1.3 and Remark 3.2 in mind). Since this procedure is standard provided that the above uniform estimates are available, we omit the details here.

It remains to verify that the local strong solution satisfies $\theta \in L^2(0, T^*; H^3(\Omega))$. To this end, we apply the elliptic regularity theorem to equation (3.6) for the transformed temperature ϑ introduced in (3.5). Using the higher-order estimate (3.48), the Sobolev embedding theorem with those relations (3.8)–(3.11) and Young's inequality, we have for a.e. $t \in [0, T^*]$

$$\begin{aligned} \|\vartheta\|_{H^3} &\leq c(\|\chi'(\vartheta)(\vartheta_t + \mathbf{u} \cdot \nabla \vartheta)\|_{H^1} + \|\vartheta\|) \\ &\leq c\|\chi'(\vartheta)\|_{L^\infty} \|\vartheta_t + \mathbf{u} \cdot \nabla \vartheta\|_{H^1} + c\|\nabla \chi'(\vartheta)\|_{\mathbf{L}^6} \|\vartheta_t + \mathbf{u} \cdot \nabla \vartheta\|_{L^3} + c\|\vartheta\| \\ &\leq c\underline{\kappa}^{-1}(\|\vartheta_t\|_{H^1} + \|\mathbf{u}\|_{\mathbf{L}^6} \|\nabla \vartheta\|_{\mathbf{L}^3} + \|\nabla \mathbf{u}\|_{\mathbf{L}^6} \|\nabla \vartheta\|_{\mathbf{L}^3} + \|\mathbf{u}\|_{\mathbf{L}^6} \|\nabla^2 \vartheta\|_{\mathbf{L}^3}) \\ &\quad + c\left\| \frac{\kappa'(\theta)}{\kappa(\theta)^2} \right\|_{L^\infty} \|\nabla \vartheta\|_{\mathbf{L}^6} (\|\vartheta_t\|_{L^3} + \|\mathbf{u}\|_{\mathbf{L}^6} \|\nabla \vartheta\|_{\mathbf{L}^6}) + c\|\vartheta\| \\ &\leq C\|\vartheta_t\|_{H^1} + C\|\mathbf{u}\|_{\mathbf{H}^1} \|\vartheta\|_{H^2}^{\frac{1}{2}} \|\vartheta\|_{H^1}^{\frac{1}{2}} + C\|\mathbf{u}\|_{\mathbf{H}^2} \|\vartheta\|_{H^2}^{\frac{1}{2}} \|\vartheta\|_{H^1}^{\frac{1}{2}} \end{aligned}$$

$$\begin{aligned}
& +C\|\mathbf{u}\|_{\mathbf{H}^1}\|\vartheta\|_{H^3}^{\frac{1}{2}}\|\vartheta\|_{H^2}^{\frac{1}{2}} + C\|\vartheta\|_{H^2}(\|\vartheta_t\|_{H^1} + \|\mathbf{u}\|_{\mathbf{H}^1}\|\vartheta\|_{H^2}) + c\|\vartheta\| \\
& \leq \frac{1}{2}\|\vartheta\|_{H^3} + C\|\theta_t\|_{H^1} + C\|\mathbf{u}\|_{\mathbf{H}^2} + C,
\end{aligned} \tag{3.50}$$

which yields that

$$\|\vartheta\|_{H^3} \leq C\|\theta_t\|_{H^1} + C\|\mathbf{u}\|_{\mathbf{H}^2} + C, \tag{3.51}$$

where the constant C in the above estimates depends on the constant $C(T^*)$ in (3.48) and the domain Ω . Then we infer from relations (3.10), (3.12), the estimates (3.48), (3.49) and (3.51) that

$$\int_0^{T^*} \|\theta(t)\|_{H^3}^2 dt \leq C(T^*).$$

Step 2. The original problem. Finally, we are able to apply the maximum principle for the temperature θ (see Lemma 3.4) to conclude that the local strong solution $(\mathbf{u}, \phi, \theta)$ to the *auxiliary* IBVP of problem (1.3)–(1.8) indeed satisfies $\|\theta(t)\|_{L^\infty} \leq \|\theta_0\|_{L^\infty}$ for all $t \in [0, T^*]$. Therefore, it follows from subsection 3.1.3 that the triple $(\mathbf{u}, \phi, \theta)$ is actually a local strong solution to the *original* problem (1.3)–(1.8). Hence, the proof for the existence of a strong solution is complete.

3.3.2 Continuous dependence and uniqueness

Uniqueness of local strong solutions to problem (1.3)–(1.8) follows from a continuous dependence result on the initial data. Let $(\mathbf{u}_1, \phi_1, \theta_1)$ and $(\mathbf{u}_2, \phi_2, \theta_2)$ be two strong solutions on the time interval $[0, T^*]$ that start from the initial data $(\mathbf{u}_{01}, \phi_{01}, \theta_{01})$, $(\mathbf{u}_{02}, \phi_{02}, \theta_{02}) \in \mathbf{V} \times H^2(\Omega) \times (H^2(\Omega) \cap H_0^1(\Omega))$, respectively. Denote the differences by

$$\begin{aligned}
\bar{\mathbf{u}} &= \mathbf{u}_1 - \mathbf{u}_2, \quad \bar{\phi} = \phi_1 - \phi_2, \quad \bar{\theta} = \theta_1 - \theta_2, \\
\bar{\mathbf{u}}_0 &= \mathbf{u}_{01} - \mathbf{u}_{02}, \quad \bar{\phi}_0 = \phi_{01} - \phi_{02}, \quad \bar{\theta}_0 = \theta_{01} - \theta_{02}.
\end{aligned}$$

We can see that $(\bar{\mathbf{u}}, \bar{\phi}, \bar{\theta})$ satisfy

$$\begin{aligned}
& \langle \bar{\mathbf{u}}_t, \mathbf{v} \rangle_{\mathbf{V}', \mathbf{V}} + \int_{\Omega} (\mathbf{u}_1 \cdot \nabla \bar{\mathbf{u}} + \bar{\mathbf{u}} \cdot \nabla \mathbf{u}_2) \cdot \mathbf{v} dx + 2 \int_{\Omega} \mu(\theta_1) \mathcal{D} \bar{\mathbf{u}} : \mathcal{D} \mathbf{v} dx \\
& + 2 \int_{\Omega} [\mu(\theta_1) - \mu(\theta_2)] \mathcal{D} \mathbf{u}_2 : \mathcal{D} \mathbf{v} dx \\
& = \int_{\Omega} [\lambda(\theta_1) \nabla \phi_1 \otimes \nabla \phi_1 - \lambda(\theta_2) \nabla \phi_2 \otimes \nabla \phi_2] : \nabla \mathbf{v} dx + \int_{\Omega} \bar{\theta} \mathbf{g} \cdot \mathbf{v} dx, \quad \forall \mathbf{v} \in \mathbf{V}, \tag{3.52}
\end{aligned}$$

$$\bar{\phi}_t + \mathbf{u}_1 \cdot \nabla \bar{\phi} + \bar{\mathbf{u}} \cdot \nabla \phi_2 = \gamma[\Delta \bar{\phi} - W'(\phi_1) + W'(\phi_2)], \tag{3.53}$$

$$\bar{\theta}_t + \mathbf{u}_1 \cdot \nabla \bar{\theta} + \bar{\mathbf{u}} \cdot \nabla \theta_2 = \nabla \cdot [\kappa(\theta_1) \nabla \bar{\theta}] + \nabla \cdot [(\kappa(\theta_1) - \kappa(\theta_2)) \nabla \theta_2], \tag{3.54}$$

$$\bar{\phi}|_{\Gamma} = 0, \quad \bar{\theta}|_{\Gamma} = 0, \tag{3.55}$$

$$\bar{\mathbf{u}}|_{t=0} = \bar{\mathbf{u}}_0, \quad \bar{\phi}|_{t=0} = \bar{\phi}_0, \quad \bar{\theta}|_{t=0} = \bar{\theta}_0. \tag{3.56}$$

Taking $\mathbf{v} = \bar{\mathbf{u}}$ in (3.52), multiplying (3.53) by $-\Delta \bar{\phi}$ and (3.54) by $-\Delta \bar{\theta}$, respectively, integrating over Ω and adding up these three resultants, then performing integration by parts and using the incompressible condition for the velocities, we get

$$\begin{aligned}
& \frac{1}{2} \frac{d}{dt} (\|\bar{\mathbf{u}}\|^2 + \|\nabla \bar{\phi}\|^2 + \|\nabla \bar{\theta}\|^2) + 2 \int_{\Omega} \mu(\theta_1) |\mathcal{D} \bar{\mathbf{u}}|^2 dx \\
& + \gamma \|\Delta \bar{\phi}\|^2 + \int_{\Omega} \kappa(\theta_1) |\Delta \bar{\theta}|^2 dx
\end{aligned}$$

$$\begin{aligned}
&= - \int_{\Omega} (\bar{\mathbf{u}} \cdot \nabla \mathbf{u}_2) \cdot \bar{\mathbf{u}} dx - 2 \int_{\Omega} [\mu(\theta_1) - \mu(\theta_2)] \mathcal{D} \mathbf{u}_2 : \mathcal{D} \bar{\mathbf{u}} dx \\
&\quad + \int_{\Omega} \lambda(\theta_1) (\nabla \phi_1 \otimes \nabla \phi_1 - \nabla \phi_2 \otimes \nabla \phi_2) : \nabla \bar{\mathbf{u}} dx \\
&\quad + \int_{\Omega} [\lambda(\theta_1) - \lambda(\theta_2)] (\nabla \phi_2 \otimes \nabla \phi_2) : \nabla \bar{\mathbf{u}} dx + \int_{\Omega} \bar{\theta} \mathbf{g} \cdot \bar{\mathbf{u}} dx \\
&\quad + \int_{\Omega} (\mathbf{u}_1 \cdot \nabla \bar{\phi}) \Delta \bar{\phi} dx + \int_{\Omega} (\bar{\mathbf{u}} \cdot \nabla \phi_2) \Delta \bar{\phi} dx + \gamma \int_{\Omega} [W'(\phi_1) - W'(\phi_2)] \Delta \bar{\phi} dx \\
&\quad + \int_{\Omega} (\mathbf{u}_1 \cdot \nabla \bar{\theta}) \Delta \bar{\theta} dx + \int_{\Omega} (\bar{\mathbf{u}} \cdot \nabla \theta_2) \Delta \bar{\theta} dx - \int_{\Omega} \kappa'(\theta_1) (\nabla \theta_1 \cdot \nabla \bar{\theta}) \Delta \bar{\theta} dx \\
&\quad - \int_{\Omega} [\kappa(\theta_1) - \kappa(\theta_2)] \Delta \theta_2 \Delta \bar{\theta} dx - \int_{\Omega} [\kappa'(\theta_1) \nabla \theta_1 - \kappa'(\theta_2) \nabla \theta_2] \cdot \nabla \theta_2 \Delta \bar{\theta} dx \\
&:= \sum_{m=1}^{13} D_m. \tag{3.57}
\end{aligned}$$

Using the L^∞ -estimate for ϕ_i, θ_i (recall Lemmas 3.3, 3.4), the Hölder inequality, Agmon's inequality and the Sobolev embedding theorem ($n = 3$), we proceed to estimate the right-hand side of (3.57) term by term.

$$\begin{aligned}
D_1 &\leq \|\bar{\mathbf{u}}\|_{\mathbf{L}^4}^2 \|\nabla \mathbf{u}_2\| \\
&\leq C \|\nabla \bar{\mathbf{u}}\|^{\frac{3}{2}} \|\bar{\mathbf{u}}\|^{\frac{1}{2}} \|\nabla \mathbf{u}_2\| \\
&\leq \epsilon \underline{\mu} \|\nabla \bar{\mathbf{u}}\|^2 + C \|\nabla \mathbf{u}_2\|^4 \|\bar{\mathbf{u}}\|^2,
\end{aligned}$$

$$\begin{aligned}
D_2 &\leq 2 \|\mu(\theta_1) - \mu(\theta_2)\|_{L^\infty} \|\nabla \mathbf{u}_2\| \|\nabla \bar{\mathbf{u}}\| \\
&\leq C \|\mu'\|_{L^\infty} \|\bar{\theta}\|_{L^\infty} \|\nabla \mathbf{u}_2\| \|\nabla \bar{\mathbf{u}}\| \\
&\leq \epsilon \underline{\mu} \|\nabla \bar{\mathbf{u}}\|^2 + C \|\nabla \mathbf{u}_2\|^2 \|\Delta \bar{\theta}\| \|\nabla \bar{\theta}\| \\
&\leq \epsilon \underline{\mu} \|\nabla \bar{\mathbf{u}}\|^2 + \epsilon \underline{\kappa} \|\Delta \bar{\theta}\|^2 + C \|\nabla \mathbf{u}_2\|^4 \|\nabla \bar{\theta}\|^2,
\end{aligned}$$

$$\begin{aligned}
D_3 &\leq \|\lambda(\theta_1)\|_{L^\infty} (\|\nabla \phi_1\|_{\mathbf{L}^6} + \|\nabla \phi_2\|_{\mathbf{L}^6}) \|\nabla \bar{\phi}\|_{\mathbf{L}^3} \|\nabla \bar{\mathbf{u}}\| \\
&\leq C (\|\phi_1\|_{H^2} + \|\phi_2\|_{H^2}) \|\nabla \bar{\phi}\|_{\mathbf{H}^1}^{\frac{1}{2}} \|\nabla \bar{\phi}\|_{\mathbf{L}^3}^{\frac{1}{2}} \|\nabla \bar{\mathbf{u}}\| \\
&\leq \epsilon \underline{\mu} \|\nabla \bar{\mathbf{u}}\|^2 + \epsilon \gamma \|\Delta \bar{\phi}\|^2 + C (\|\phi_1\|_{H^2}^4 + \|\phi_2\|_{H^2}^4) \|\nabla \bar{\phi}\|^2,
\end{aligned}$$

$$\begin{aligned}
D_4 &\leq \lambda_0 |b| \|\bar{\theta}\|_{L^\infty} \|\nabla \phi_2\|_{\mathbf{L}^4}^2 \|\nabla \bar{\mathbf{u}}\| \\
&\leq C \|\Delta \bar{\theta}\|_{\mathbf{H}^1}^{\frac{1}{2}} \|\nabla \bar{\theta}\|_{\mathbf{H}^1}^{\frac{1}{2}} \|\phi_2\|_{H^2}^2 \|\nabla \bar{\mathbf{u}}\| \\
&\leq \epsilon \underline{\mu} \|\nabla \bar{\mathbf{u}}\|^2 + \epsilon \underline{\kappa} \|\Delta \bar{\theta}\|^2 + C \|\phi_2\|_{H^2}^4 \|\nabla \bar{\theta}\|^2,
\end{aligned}$$

$$D_5 \leq C \|\bar{\theta}\| \|\bar{\mathbf{u}}\| \leq C \|\bar{\mathbf{u}}\|^2 + C \|\nabla \bar{\theta}\|^2,$$

$$\begin{aligned}
D_6 + D_9 &\leq \|\mathbf{u}_1\|_{\mathbf{L}^6} (\|\nabla \bar{\phi}\|_{\mathbf{L}^3} \|\Delta \bar{\phi}\| + \|\nabla \bar{\theta}\|_{\mathbf{L}^3} \|\Delta \bar{\theta}\|) \\
&\leq C \|\nabla \mathbf{u}_1\| (\|\nabla \bar{\phi}\|_{\mathbf{H}^1}^{\frac{1}{2}} \|\nabla \bar{\phi}\|_{\mathbf{L}^3}^{\frac{1}{2}} \|\Delta \bar{\phi}\| + \|\nabla \bar{\theta}\|_{\mathbf{H}^1}^{\frac{1}{2}} \|\nabla \bar{\theta}\|_{\mathbf{L}^3}^{\frac{1}{2}} \|\Delta \bar{\theta}\|) \\
&\leq \epsilon \gamma \|\Delta \bar{\phi}\|^2 + \epsilon \underline{\kappa} \|\Delta \bar{\theta}\|^2 + C \|\nabla \mathbf{u}_1\|^4 (\|\nabla \bar{\phi}\|^2 + \|\nabla \bar{\theta}\|^2),
\end{aligned}$$

$$D_7 + D_{10} \leq \|\bar{\mathbf{u}}\|_{\mathbf{L}^3} (\|\nabla \phi_2\|_{\mathbf{L}^6} \|\Delta \bar{\phi}\| + \|\nabla \theta_2\|_{\mathbf{L}^6} \|\Delta \bar{\theta}\|)$$

$$\begin{aligned}
&\leq C\|\bar{\mathbf{u}}\|^{\frac{1}{2}}\|\nabla\mathbf{u}\|^{\frac{1}{2}}(\|\phi_2\|_{H^2}\|\Delta\bar{\phi}\| + \|\theta_2\|_{H^2}\|\Delta\bar{\theta}\|) \\
&\leq \epsilon\mu\|\nabla\bar{\mathbf{u}}\|^2 + \epsilon\gamma\|\Delta\bar{\phi}\|^2 + \epsilon\underline{\kappa}\|\Delta\bar{\theta}\|^2 + C(\|\phi_2\|_{H^2}^4 + \|\theta_2\|_{H^2}^4)\|\bar{\mathbf{u}}\|^2,
\end{aligned}$$

$$\begin{aligned}
D_8 &\leq \gamma\left\|\bar{\phi}\int_0^1 W''(s\phi_1 + (1-s)\phi_2)ds\right\|_{L^\infty}\|\Delta\bar{\phi}\| \\
&\leq C\gamma\|W''\|_{L^\infty}\|\bar{\phi}\|_{L^\infty}\|\Delta\bar{\phi}\| \\
&\leq C\gamma\|\Delta\bar{\phi}\|^{\frac{3}{2}}\|\nabla\bar{\phi}\|^{\frac{1}{2}} \\
&\leq \epsilon\gamma\|\Delta\bar{\phi}\|^2 + C\|\nabla\bar{\phi}\|^2,
\end{aligned}$$

$$\begin{aligned}
D_{11} &\leq \|\kappa'(\theta_1)\|_{L^\infty}\|\nabla\theta_1\|_{\mathbf{L}^6}\|\nabla\bar{\theta}\|_{\mathbf{L}^3}\|\Delta\bar{\theta}\| \\
&\leq C\|\theta_1\|_{H^2}\|\nabla\bar{\theta}\|^{\frac{1}{2}}\|\Delta\bar{\theta}\|^{\frac{3}{2}} \\
&\leq \epsilon\underline{\kappa}\|\Delta\bar{\theta}\|^2 + C\|\theta_1\|_{H^2}^4\|\nabla\bar{\theta}\|^2,
\end{aligned}$$

$$\begin{aligned}
D_{12} &\leq \|\kappa'\|_{L^\infty}\|\bar{\theta}\|_{L^\infty}\|\Delta\theta_2\|\|\Delta\bar{\theta}\| \\
&\leq C\|\theta_2\|_{H^2}\|\nabla\bar{\theta}\|^{\frac{1}{2}}\|\Delta\bar{\theta}\|^{\frac{3}{2}} \\
&\leq \epsilon\underline{\kappa}\|\Delta\bar{\theta}\|^2 + C\|\theta_2\|_{H^2}^4\|\nabla\bar{\theta}\|^2,
\end{aligned}$$

$$\begin{aligned}
D_{13} &\leq \|\kappa'(\theta_1)\|_{L^\infty}\|\nabla\bar{\theta}\|_{\mathbf{L}^3}\|\nabla\theta_2\|_{\mathbf{L}^6}\|\Delta\bar{\theta}\| + \|\kappa''\|_{L^\infty}\|\bar{\theta}\|_{L^\infty}\|\nabla\theta_2\|_{\mathbf{L}^4}^2\|\Delta\bar{\theta}\| \\
&\leq C\|\nabla\bar{\theta}\|_{\mathbf{H}^1}^{\frac{1}{2}}\|\nabla\bar{\theta}\|^{\frac{1}{2}}\|\theta_2\|_{H^2}\|\Delta\bar{\theta}\| + C\|\Delta\bar{\theta}\|^{\frac{1}{2}}\|\nabla\bar{\theta}\|^{\frac{1}{2}}\|\theta_2\|_{H^2}^2\|\Delta\bar{\theta}\| \\
&\leq \epsilon\underline{\kappa}\|\Delta\bar{\theta}\|^2 + C\|\theta_2\|_{H^2}^4\|\nabla\bar{\theta}\|^2.
\end{aligned}$$

Taking the constant $\epsilon > 0$ to be sufficiently small in the above estimates, we infer from (3.57) that

$$\begin{aligned}
&\frac{d}{dt}(\|\bar{\mathbf{u}}\|^2 + \|\nabla\bar{\phi}\|^2 + \|\nabla\bar{\theta}\|^2) + \underline{\mu}\|\nabla\bar{\mathbf{u}}\|^2 + \gamma\|\Delta\bar{\phi}\|^2 + \underline{\kappa}\|\Delta\bar{\theta}\|^2 \\
&\leq Q(t)(\|\bar{\mathbf{u}}\|^2 + \|\nabla\bar{\phi}\|^2 + \|\nabla\bar{\theta}\|^2), \quad \forall t \in [0, T^*],
\end{aligned}$$

where

$$Q(t) = C(\|\nabla\mathbf{u}_1\|^4 + \|\nabla\mathbf{u}_2\|^4 + \|\phi_1\|_{H^2}^4 + \|\phi_2\|_{H^2}^4 + \|\theta_1\|_{H^2}^4 + \|\theta_2\|_{H^2}^4)$$

with C being a constant that may depend on Ω , $\|\phi_0\|_{L^\infty}$, $\|\theta_0\|_{L^\infty}$ and coefficients of the system.

Since the $\mathbf{V} \times H^2(\Omega) \times H^2(\Omega)$ -norm of these two strong solutions $(\mathbf{u}_i, \phi_i, \theta_i)$ ($i = 1, 2$) to problem (1.3)–(1.8) are bounded on $[0, T^*]$ (recall (3.48)), then the quantity $Q(t)$ is also bounded on $[0, T^*]$ such that $Q(t) \leq C(T^*)$ for $t \in [0, T^*]$. As a consequence, it easily follows from the Gronwall inequality that

$$\begin{aligned}
&\|\bar{\mathbf{u}}(t)\|^2 + \|\nabla\bar{\phi}(t)\|^2 + \|\nabla\bar{\theta}(t)\|^2 + \int_0^t \left(\underline{\mu}\|\nabla\bar{\mathbf{u}}\|^2 + \gamma\|\Delta\bar{\phi}\|^2 + \underline{\kappa}\|\Delta\bar{\theta}\|^2 \right) d\tau \\
&\leq (\|\bar{\mathbf{u}}_0\|^2 + \|\nabla\bar{\phi}_0\|^2 + \|\nabla\bar{\theta}_0\|^2) e^{C(T^*)t}, \quad \forall t \in [0, T^*].
\end{aligned} \tag{3.58}$$

The above estimate indicates that the local strong solution to problem (1.3)–(1.8) continuously depends on its initial data in $\mathbf{H} \times H^1(\Omega) \times H^1(\Omega)$, which also immediately yields the uniqueness result.

The proof of Theorem 2.1 is now complete.

Remark 3.3. *Because of the highly nonlinear structure of problem (1.3)–(1.8), we are not able to improve the continuous dependence result for strong solutions to the higher-order space like $\mathbf{V} \times H^2 \times H^2$ when the spatial dimension is three. The two dimensional case might be possible, but the proof would be rather involved. We refer to [18] for a continuous dependence result in the H^2 -topology for the 2D Boussinesq system with variable viscosity and thermal diffusivity (without coupling with the phase-field equation).*

4 Global Solutions in 2D

4.1 Global weak solutions

Similar to Section 3, the existence of global weak solutions can be proved by using a suitable semi-Galerkin approximate scheme, provided that certain uniform lower-order global-in-time estimates can be obtained. However, such global estimates are in general not available due to the lack of dissipative energy law for problem (1.3)–(1.8) (cf. Step 1 in the proof of Lemma 3.6). In order to avoid this difficulty, we shall assume that the initial temperature variation i.e., $\|\theta_0\|_{L^\infty}$ is suitably bounded. Moreover, this bound will be preserved in the associated Galerkin approximation (i.e., Type B in Appendix).

4.1.1 L^∞ -bound for the initial temperature

For any function $\phi \in H^2(\Omega)$ with $\phi|_\Gamma = \phi_b \in H^{\frac{3}{2}}(\Gamma)$, we recall the following interpolation inequality as well as the elliptic estimate in 2D:

$$\|\nabla \phi\|_{\mathbf{L}^4}^2 \leq c_1 \|\phi\|_{H^2} \|\phi\|_{L^\infty}, \quad (4.1)$$

$$\|\phi\|_{H^2} \leq c_2 \left(\|\Delta \phi\| + \|\phi\| + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)} \right). \quad (4.2)$$

Similarly, we have the interpolation inequality in 2D for any $\theta \in H^2(\Omega) \cap H_0^1(\Omega)$:

$$\|\nabla \theta\|_{\mathbf{L}^4}^2 \leq c_3 \|\Delta \theta\| \|\theta\|_{L^\infty}, \quad (4.3)$$

In (4.1)–(4.3), c_1 , c_2 and c_3 are positive constants that only depend on Ω .

Since the viscosity function $\mu(\cdot)$ is continuous and $\mu(s) > 0$ for all $s \in \mathbb{R}$, we deduce that

$$\Theta_1 := \sup_{l \geq 0} \left\{ \min \left\{ l, \frac{1}{2c_1 c_2 |b|} \sqrt{\frac{a\gamma \min_{s \in [-l, l]} \mu(s)}{2\lambda_0}} \right\} \right\} \quad (4.4)$$

is a finite positive constant. Indeed, by monotonicity, Θ_1 satisfies the relation

$$\Theta_1 = \frac{1}{2c_1 c_2 |b|} \sqrt{\frac{a\gamma \min_{s \in [-\Theta_1, \Theta_1]} \mu(s)}{2\lambda_0}}.$$

After fixing the number Θ_1 , we set (compare with subsection 3.1.3)

$$\underline{\mu} := \min_{s \in [-\Theta_1, \Theta_1]} \mu(s) > 0, \quad (4.5)$$

$$\bar{\mu} := \max_{s \in [-\Theta_1, \Theta_1]} \mu(s) > 0. \quad (4.6)$$

Similarly, since the thermal diffusivity $\kappa(\cdot)$ is a C^2 function and $\kappa(s) > 0$ for all $s \in \mathbb{R}$, we can set

$$\underline{\kappa} := \min_{s \in [-\Theta_1, \Theta_1]} \kappa(s) > 0, \quad (4.7)$$

$$\bar{\kappa} := \max_{s \in [-\Theta_1, \Theta_1]} \kappa(s) > 0. \quad (4.8)$$

Moreover, there exists a constant $\Theta_2 \in (0, \Theta_1]$ such that

$$\Theta_2 = \max \left\{ l : l \in (0, \Theta_1] \text{ and } \max_{s \in [-l, l]} l |\kappa'(s)| \leq \frac{\underline{\kappa}}{4c_3} \right\}. \quad (4.9)$$

Remark 4.1. In the remaining part of this section, we shall assume that the L^∞ -norm of the initial temperature θ_0 satisfies either $\|\theta_0\|_{L^\infty} \leq \Theta_1$ or $\|\theta_0\|_{L^\infty} \leq \Theta_2 \in (0, \Theta_1]$. It is easy to see from the definition that

$$\begin{aligned} \min_{s \in [-\Theta_1, \Theta_1]} \mu(s) &\leq \min_{s \in [-\Theta_2, \Theta_2]} \mu(s) \leq \max_{s \in [-\Theta_2, \Theta_2]} \mu(s) \leq \max_{s \in [-\Theta_1, \Theta_1]} \mu(s), \\ \min_{s \in [-\Theta_1, \Theta_1]} \kappa(s) &\leq \min_{s \in [-\Theta_2, \Theta_2]} \kappa(s) \leq \max_{s \in [-\Theta_2, \Theta_2]} \kappa(s) \leq \max_{s \in [-\Theta_1, \Theta_1]} \kappa(s). \end{aligned}$$

Then by the weak maximum principle Lemma 3.4, for both cases we can simply choose the positive lower and upper bounds $\underline{\mu}$, $\bar{\mu}$, $\underline{\kappa}$, $\bar{\kappa}$ for the viscosity $\mu(\cdot)$ and thermal diffusivity $\kappa(\cdot)$ as in (4.5)–(4.8).

4.1.2 A priori estimates

After the above preparations, in what follows, we derive some *a priori* estimates on lower-order norms of solutions to problem (1.3)–(1.8).

Proposition 4.1. Let $n = 2$. Suppose that $|\phi_0| \leq 1$ a.e. in Ω , $|\phi_b| \leq 1$ on Γ and θ_0 satisfies the assumption $\|\theta_0\|_{L^\infty} \leq \Theta_1$, where Θ_1 is given in (4.4). Then for arbitrary $T \in (0, +\infty)$, the smooth solution $(\mathbf{u}, \phi, \theta)$ to problem (1.3)–(1.8) satisfies the following estimates

$$\begin{cases} \|\mathbf{u}\|_{L^\infty(0, T; \mathbf{H})} + \|\mathbf{u}\|_{L^2(0, T; \mathbf{V})} \leq C_T, \\ \|\phi\|_{L^\infty(0, T; H^1)} + \|\phi\|_{L^2(0, T; H^2)} \leq C_T, \\ \|\theta\|_{L^\infty(0, T; H^1)} + \|\theta\|_{L^2(0, T; H^2)} + \|\theta_t\|_{L^2(0, T; L^2)} \leq C_T, \end{cases} \quad (4.10)$$

where C_T is a constant depending on $\|\mathbf{u}_0\|$, $\|\phi_0\|_{H^1 \cap L^\infty}$, $\|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}$, $\|\theta_0\|_{H^1}$, Θ_1 , T , Ω and coefficients of the system.

Proof. Similar to Step 1 of the proof to Lemma 3.6, we still have the differential equality (3.21). Recalling the estimate (3.23) for the sum $J_1 + J_3$, using weak maximum principles for ϕ , θ (see Lemmas 3.3, 3.4), and the estimates (4.1), (4.2), (4.4), (4.5), we obtain that

$$\begin{aligned} J_1 + J_3 &\leq \frac{\mu}{4} \|\nabla \mathbf{u}\|^2 + \frac{|b|^2 \lambda_0^2}{\mu} \|\theta\|_{L^\infty}^2 \|\nabla \phi\|_{\mathbf{L}^4}^4 \\ &\leq \frac{\mu}{4} \|\nabla \mathbf{u}\|^2 + \frac{c_1^2 |b|^2 \lambda_0^2}{\mu} \|\theta\|_{L^\infty}^2 \|\phi\|_{H^2}^2 \|\phi\|_{L^\infty}^2 \\ &\leq \frac{\mu}{4} \|\nabla \mathbf{u}\|^2 + \frac{4c_1^2 c_2^2 |b|^2 \lambda_0^2}{\mu} \|\theta\|_{L^\infty}^2 \|\phi\|_{L^\infty}^2 \\ &\quad \times \left(\|\Delta \phi - W'(\phi)\|^2 + \|W'(\phi)\|^2 + \|\phi\|^2 + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}^2 \right) \\ &\leq \frac{\mu}{4} \|\nabla \mathbf{u}\|^2 + \frac{a\lambda_0\gamma}{2} \|\Delta \phi - W'(\phi)\|^2 + C. \end{aligned} \quad (4.11)$$

The term J_2 in (3.21) can be estimated in the same way as in (3.22). Therefore, we can deduce from (3.21), (3.22) and (4.11) that:

$$\begin{aligned} & \frac{d}{dt} \left(\|\mathbf{u}\|^2 + a\lambda_0 \|\nabla \phi\|^2 + 2a\lambda_0 \int_{\Omega} W(\phi) dx \right) \\ & \quad + \underline{\mu} \|\nabla \mathbf{u}\|^2 + a\lambda_0 \gamma \|\Delta \phi - W'(\phi)\|^2 \\ & \leq C, \end{aligned}$$

where C is a constant depending on $\|\phi_0\|_{L^\infty}$, $\|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}$, $\|\theta_0\|_{L^\infty}$ and coefficients of the system. Integrating the above inequality with respect to time, we infer from Young's inequality that for any $T \in (0, +\infty)$, it holds

$$\sup_{t \in [0, T]} (\|\mathbf{u}(t)\|^2 + \|\phi(t)\|_{H^1}^2) + \int_0^T (\|\nabla \mathbf{u}(t)\|^2 + \|\phi(t)\|_{H^2}^2) dt \leq C_T, \quad (4.12)$$

where C_T is a constant depending on $\|\mathbf{u}_0\|$, $\|\phi_0\|_{H^1 \cap L^\infty}$, $\|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}$, $\|\theta_0\|_{L^\infty}$, T , Ω and coefficients of the system.

Next, keeping the assumption $\|\theta_0\|_{L^\infty} \leq \Theta_1$ in mind, using the temperature transformation (3.5), we can apply Lemmas 3.4, 3.5 to problem (3.6) with the diffusivity $\tilde{\kappa}(\vartheta) = \frac{1}{\chi'(\vartheta)}$ to get (here $n = 2$)

$$\frac{d}{dt} \|\nabla \vartheta\|^2 + \frac{1}{\tilde{\kappa}} \|\vartheta_t\|^2 \leq C(1 + \|\mathbf{u}\|^2 \|\nabla \mathbf{u}\|^2) \|\nabla \vartheta\|^2.$$

It follows from (4.12) and the Gronwall lemma that

$$\|\nabla \vartheta(t)\|^2 + \int_0^t \|\vartheta_t(\tau)\|^2 d\tau \leq C_T, \quad \forall t \in [0, T], \quad (4.13)$$

which together with the estimate (3.16) ($n = 2$), (4.12) and (4.13) yields that

$$\int_0^t \|\vartheta(\tau)\|_{H^2}^2 d\tau \leq C_T, \quad \forall t \in [0, T]. \quad (4.14)$$

Then we easily infer from (4.13), (4.14), the relations (3.8), (3.10) and (4.3) that

$$\|\nabla \theta(t)\|^2 + \int_0^t (\|\theta_t(\tau)\|^2 + \|\theta(\tau)\|_{H^2}^2) d\tau \leq C_T, \quad \forall t \in [0, T], \quad (4.15)$$

where C_T is a constant depending on $\|\mathbf{u}_0\|$, $\|\phi_0\|_{H^1 \cap L^\infty}$, $\|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}$, $\|\theta_0\|_{H^1 \cap L^\infty}$, T , Ω and coefficients of the system. The proof is complete. \square

If the initial temperature θ_0 fulfills a slightly stronger assumption, indeed we can show that problem (1.3)–(1.8) admits a dissipative energy law:

Lemma 4.1. *Let $n = 2$. We assume that $|\phi_0| \leq 1$ a.e. in Ω , $|\phi_b| \leq 1$ on Γ and θ_0 satisfies $\|\theta_0\|_{L^\infty} \leq \Theta_2$, where Θ_2 is given in (4.9). Introduce the energy functional*

$$\mathcal{E}(t) = \|\mathbf{u}(t)\|^2 + a\lambda_0 \|\nabla \phi(t)\|^2 + 2a\lambda_0 \int_{\Omega} W(\phi(t)) dx + \zeta \|\nabla \theta(t)\|^2 + \omega \|\theta(t)\|^2, \quad (4.16)$$

where the constants $\zeta, \omega > 0$ may depend on Ω , Θ_2 and coefficients of problem (1.3)–(1.8). Then the following energy inequality holds:

$$\frac{d}{dt} \mathcal{E}(t) + \frac{\mu}{2} \|\nabla \mathbf{u}\|^2 + a\lambda_0 \gamma \|\Delta \phi + W'(\phi)\|^2 + \frac{\zeta \kappa}{2} \|\Delta \theta\|^2 \leq 0, \quad \forall t > 0. \quad (4.17)$$

Proof. Let $\zeta > 0$ be a constant to be determined later (see (4.18) below). Multiplying equation (1.6) with $-\zeta\Delta\theta$, integrating over Ω and adding the resultant with (3.21), we have

$$\begin{aligned} & \frac{1}{2} \frac{d}{dt} \left(\|\mathbf{u}\|^2 + a\lambda_0 \|\nabla\phi\|^2 + 2a\lambda_0 \int_{\Omega} F(\phi) dx + \zeta \|\nabla\theta\|^2 \right) \\ & + 2 \int_{\Omega} \mu(\theta) |\mathcal{D}\mathbf{u}|^2 dx + a\gamma\lambda_0 \|\Delta\phi - W'(\phi)\|^2 + \zeta \int_{\Omega} \kappa(\theta) |\Delta\theta|^2 dx \\ = & J_1 + J_2 + J_3 + \zeta \int_{\Omega} (\mathbf{u} \cdot \nabla) \theta \Delta\theta dx - \zeta \int_{\Omega} \kappa'(\theta) |\nabla\theta|^2 \Delta\theta dx, \end{aligned}$$

where J_1 , J_2 and J_3 are the same as in (3.21) and we denote the last two terms on the right-hand side of the above equality by J_4 , J_5 , respectively.

By Lemmas 3.3, 3.4 and the assumption $\|\theta_0\|_{L^\infty} \leq \Theta_2 \in (0, \Theta_1]$ (see (4.9)), the terms in the second last line of (4.11) can be re-estimated as follows

$$\frac{4c_1^2 c_2^2 |b|^2 \lambda_0^2}{\underline{\mu}} \|\theta\|_{L^\infty}^2 \|\phi\|_{L^\infty}^2 \|\Delta\phi - W'(\phi)\|^2 \leq \frac{a\lambda_0\gamma}{2} \|\Delta\phi - W'(\phi)\|^2,$$

and by Agmon's inequality ($n = 2$), it holds

$$\begin{aligned} & \frac{4c_1^2 c_2^2 |b|^2 \lambda_0^2}{\underline{\mu}} \|\theta\|_{L^\infty}^2 \|\phi\|_{L^\infty}^2 \left(\|W'(\phi)\|^2 + \|\phi\|^2 + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}^2 \right) \\ \leq & C \|\Delta\theta\| \|\theta\| \\ \leq & \frac{\zeta\kappa}{4} \|\Delta\theta\|^2 + C \|\theta\|^2. \end{aligned}$$

As a result, we have

$$J_1 + J_3 \leq \frac{\mu}{4} \|\nabla\mathbf{u}\|^2 + \frac{a\lambda_0\gamma}{2} \|\Delta\phi - W'(\phi)\|^2 + \frac{\zeta\kappa}{4} \|\Delta\theta\|^2 + C \|\theta\|^2.$$

Again, the term J_2 can be estimated in the same way as (3.22). Next, for J_4 and J_5 , using the assumption $\|\theta_0\|_{L^\infty} \leq \Theta_2$, Lemma 3.4 and the Gagliardo–Nirenberg inequality (4.3), we deduce that

$$\begin{aligned} J_4 &= -\zeta \int_{\Omega} \mathbf{u} \cdot \nabla \left(\frac{|\nabla\theta|^2}{2} \right) dx + \zeta \int_{\Omega} \mathbf{u} \cdot [\nabla \cdot (\nabla\theta \otimes \nabla\theta)] dx \\ &= -\zeta \int_{\Omega} \nabla\mathbf{u} : (\nabla\theta \otimes \nabla\theta) dx \\ &\leq \zeta \|\nabla\mathbf{u}\| \|\nabla\theta\|_{\mathbf{L}^4}^2 \\ &\leq c_3 \zeta \|\nabla\mathbf{u}\| \|\Delta\theta\| \|\theta\|_{L^\infty} \\ &\leq \frac{\zeta\kappa}{4} \|\Delta\theta\|^2 + \frac{\zeta c_3^2}{\underline{\kappa}} \|\theta_0\|_{L^\infty}^2 \|\nabla\mathbf{u}\|^2 \\ &\leq \frac{\zeta\kappa}{4} \|\Delta\theta\|^2 + \frac{\zeta c_3^2 \Theta_2^2}{\underline{\kappa}} \|\nabla\mathbf{u}\|^2, \end{aligned}$$

and

$$\begin{aligned} J_5 &\leq \zeta \|\kappa'(\theta)\|_{L^\infty} \|\nabla\theta\|_{\mathbf{L}^4}^2 \|\Delta\theta\| \\ &\leq \zeta c_3 \|\kappa'(\theta)\|_{L^\infty} \|\theta\|_{L^\infty} \|\Delta\theta\|^2 \\ &\leq \frac{\zeta\kappa}{4} \|\Delta\theta\|^2. \end{aligned}$$

Now taking

$$\zeta = \frac{\mu \underline{\kappa}}{4c_3^2 \Theta_2^2} > 0, \quad (4.18)$$

we infer from the above estimates that

$$\begin{aligned} & \frac{d}{dt} \left(\|\mathbf{u}\|^2 + a\lambda_0 \|\nabla \phi\|^2 + 2a\lambda_0 \int_{\Omega} F(\phi) dx + \zeta \|\nabla \theta\|^2 \right) \\ & + \frac{\mu}{2} \|\nabla \mathbf{u}\|^2 + a\lambda_0 \gamma \|\Delta \phi - F'(\phi)\|^2 + \frac{\zeta \underline{\kappa}}{2} \|\Delta \theta\|^2 \\ & \leq C_1 \|\theta\|^2. \end{aligned} \quad (4.19)$$

Next, multiplying the equation (1.6) by $2\omega\theta$, with $\omega = \frac{C_1}{2\underline{\kappa}} > 0$, integrating over Ω , and using Poincaré's inequality for θ , we obtain

$$\omega \frac{d}{dt} \|\theta\|^2 = -2\omega \int_{\Omega} \kappa(\theta) |\nabla \theta|^2 dx \leq -2\omega \underline{\kappa} \|\nabla \theta\|^2 = -C_1 \|\nabla \theta\|^2. \quad (4.20)$$

Adding (4.19) with (4.20), we arrive at our conclusion (4.17). The proof is complete. \square

As a direct consequence of the above lemma, we can derive the following *uniform-in-time* estimates for $(\mathbf{u}, \phi, \theta)$:

Proposition 4.2. *Let $n = 2$. Under the assumptions of Lemma 4.1, the smooth solution $(\mathbf{u}, \phi, \theta)$ to problem (1.3)–(1.8) satisfies the following energy inequality*

$$\mathcal{E}(t) + \int_0^t \left(\frac{\mu}{2} \|\nabla \mathbf{u}\|^2 + a\lambda_0 \gamma \|\Delta \phi - W'(\phi)\|^2 + \frac{\zeta \underline{\kappa}}{2} \|\Delta \theta\|^2 \right) dt \leq \mathcal{E}(0), \quad \forall t \geq 0,$$

which yields that

$$\|\mathbf{u}(t)\|^2 + \|\phi(t)\|_{H^1}^2 + \|\theta(t)\|_{H^1}^2 \leq C, \quad \forall t \geq 0, \quad (4.21)$$

$$\int_0^{+\infty} (\|\nabla \mathbf{u}(t)\|^2 + \|\Delta \phi(t) - W'(\phi(t))\|^2 + \|\Delta \theta(t)\|^2) dt \leq C, \quad (4.22)$$

where $C > 0$ is a constant depending on $\|\mathbf{u}_0\|$, $\|\phi_0\|_{H^1 \cap L^\infty}$, $\|\theta_0\|_{H^1}$, Θ_2 , Ω and coefficients of the system, but not on the time t .

4.1.3 Proof of Theorems 2.2

Using the global *a priori* estimates obtained in Proposition 4.1 if $\|\theta_0\|_{L^\infty} \leq \Theta_1$ (or Proposition 4.2 if $\|\theta_0\|_{L^\infty} \leq \Theta_2$) and the Sobolev embedding theorem ($n = 2$), we can see that for any $\mathbf{v} \in \mathbf{V}$, it holds

$$\begin{aligned} |\langle \mathbf{u}_t, \mathbf{v} \rangle_{\mathbf{V}', \mathbf{V}}| & \leq \left| \int_{\Omega} (\mathbf{u} \cdot \nabla) \mathbf{u} \cdot \mathbf{v} dx \right| + 2 \left| \int_{\Omega} \mu(\theta) \mathcal{D} \mathbf{u} : \mathcal{D} \mathbf{v} dx \right| \\ & \quad + \left| \int_{\Omega} [\lambda(\theta) \nabla \phi \otimes \nabla \phi] : \nabla \mathbf{v} dx \right| + \left| \int_{\Omega} \theta \mathbf{g} \cdot \mathbf{v} dx \right| \\ & \leq \left| \int_{\Omega} (\mathbf{u} \otimes \mathbf{u}) : \nabla \mathbf{v} dx \right| + 2 \|\mu(\theta)\|_{L^\infty} \|\mathcal{D} \mathbf{u}\| \|\mathcal{D} \mathbf{v}\| \\ & \quad + \|\lambda(\theta)\|_{L^\infty} \|\nabla \phi\|_{\mathbf{L}^4}^2 \|\nabla \mathbf{v}\| + C \|\theta\| \|\mathbf{v}\| \\ & \leq C \|\mathbf{u}\|_{\mathbf{L}^4}^2 \|\nabla \mathbf{v}\| + C \|\nabla \mathbf{u}\| \|\nabla \mathbf{v}\| + C \|\nabla \phi\|_{\mathbf{L}^4}^2 \|\nabla \mathbf{v}\| + C \|\theta\| \|\nabla \mathbf{v}\| \\ & \leq C (\|\mathbf{u}\| \|\nabla \mathbf{u}\| + \|\nabla \mathbf{u}\| + \|\phi\|_{H^2} \|\phi\|_{H^1} + \|\theta\|) \|\nabla \mathbf{v}\|, \end{aligned}$$

which implies that $\mathbf{u}_t \in L^2(0, T; \mathbf{V}')$. On the other hand, it is also easy to check that $\phi_t, \theta_t \in L^2(0, T; L^2(\Omega))$. Then the existence of global weak solutions to problem (1.3)–(1.8) in 2D can be proved by working with a suitable semi-Galerkin approximate scheme (for instance, Type B in Appendix) and the standard compactness argument. The details are omitted here.

Remark 4.2. *Different from the classical two-dimensional Navier–Stokes equations, uniqueness of global weak solutions to problem (1.3)–(1.8) is an open issue in the 2D case. One of the technical difficulties comes from the estimate on the higher-order nonlinear term*

$$-2 \int_{\Omega} [\mu(\theta_1) - \mu(\theta_2)] \mathcal{D}\mathbf{u}_2 : \mathcal{D}(\mathbf{u}_1 - \mathbf{u}_2) dx,$$

which is induced by the non-constant temperature-dependent viscosity $\mu(\theta)$. On the other hand, a weak-strong uniqueness result would be possible and we leave the details to interested readers.

4.2 Global strong solutions

In what follows, we shall prove the existence and uniqueness of global strong solutions to problem (1.3)–(1.8) in 2D, under the same assumptions on $\|\theta_0\|_{L^\infty}$ as for the case of global weak solutions. Since existence and uniqueness of local strong solutions in 2D have been proved in Section 3, below we only need to derive necessary global-in-time estimates for the strong solutions and then apply the extension theorem.

The following lemma for the Stokes problem with variable viscosity coefficient will be helpful to prove higher-order spatial estimates for the velocity field \mathbf{u} . It can be obtained by the localization and freezing coefficients method (see e.g., [35, Lemma 2.1] for a slightly different version).

Lemma 4.2. *For $n \geq 2$, consider the Stokes problem*

$$\begin{cases} -\nabla \cdot (2\mu(x)\mathcal{D}\mathbf{u}) + \nabla P = \mathbf{f}, & x \in \Omega, \\ \nabla \cdot \mathbf{u} = 0, & x \in \Omega, \\ \int_{\Omega} P dx = 0, \\ \mathbf{u} = \mathbf{0}, & x \in \Gamma, \end{cases} \quad (4.23)$$

where the coefficient $\mu(x) \in H^2(\Omega)$ and satisfies $0 < \underline{\mu} \leq \mu(x) \leq \bar{\mu} < +\infty$. If $\mathbf{f} \in \mathbf{V}'$, then problem (4.23) admits a unique weak solution $(\mathbf{u}, P) \in \mathbf{V} \times L^2(\Omega)$ such that

$$\|\mathbf{u}\|_{\mathbf{H}^1} + \|P\| \leq C\|\mathbf{f}\|_{\mathbf{H}^{-1}}, \quad (4.24)$$

where $C = C(\Omega, n, \underline{\mu}, \bar{\mu})$ is a positive constant. Moreover, if $n = 2$ and $\mathbf{f} \in \mathbf{L}^2(\Omega)$, then $(\mathbf{u}, P) \in (\mathbf{H}^2(\Omega) \cap \mathbf{V}) \times H^1(\Omega)$ and there exists a constant $C = C(\Omega, [\mu]_\delta, \underline{\mu}, \bar{\mu})$ such that the following estimate holds:

$$\|\Delta \mathbf{u}\| + \|\nabla P\| \leq C\left(\|\mathbf{f}\| + \|\mu\|_{H^1} \|\mu\|_{H^2} \|\nabla \mathbf{u}\| + \|P\|\right), \quad (4.25)$$

for some $\delta \in (0, 1)$.

Besides, the following Hölder estimate for θ (see [35, Lemma 3.2]) will be necessary in order to make use of Lemma 4.2:

Lemma 4.3. Suppose that $n = 2$ and $\mathbf{u} \in L^4(0, T; \mathbf{L}^4(\Omega))$. Consider the initial boundary value problem (3.2). If $\theta \in L^\infty(0, T; L^2(\Omega)) \cap L^2(0, T; H_0^1(\Omega))$ is a weak solution of (3.2) and $\theta_0 \in C^\alpha(\overline{\Omega})$ for some $\alpha \in (0, 1)$, then there exist two positive constants C and $\delta \in (0, \alpha]$ depending only on $\Omega, \underline{\kappa}, \|\theta_0\|_{L^\infty}, [\theta_0]_\alpha$ and $\|\mathbf{u}\|_{L^4(0, T; \mathbf{L}^4)}$ such that

$$[\theta]_{C^{\frac{\delta}{2}, \delta}} \leq C,$$

where the Hölder semi-norm of θ is given by $[\theta]_{C^{\frac{\delta}{2}, \delta}} = \sup_{(t,x) \neq (\tau,y) \in (0,T) \times \Omega} \frac{|\theta(t,x) - \theta(\tau,y)|}{(|t-\tau|^{\frac{1}{2}} + |x-y|)^\delta}$.

4.2.1 A priori estimates

First, we derive some useful higher-order differential inequalities:

Lemma 4.4. Suppose that $n = 2$, $|\phi_0| \leq 1$ in Ω , $|\phi_b| \leq 1$ on Γ and θ_0 satisfies either $\|\theta_0\|_{L^\infty} \leq \Theta_1$ or $\|\theta_0\|_{L^\infty} \leq \Theta_2$. Let $(\mathbf{u}, \phi, \theta)$ be a smooth solution to problem (1.3)–(1.8). Then we have the following differential inequalities:

$$\begin{aligned} & \frac{d}{dt} \left(\int_{\Omega} \mu(\theta) |\mathcal{D}\mathbf{u}|^2 dx + \frac{1}{2} \|\Delta\phi - W'(\phi)\|^2 \right) + (1 - 3\epsilon) \|\mathbf{u}_t\|^2 \\ & + (\gamma - 4\epsilon) \|\nabla(\Delta\phi - W'(\phi))\|^2 \\ \leq & (\epsilon + C_3 \epsilon^{-2} \|\nabla\theta\|^4 \|\nabla\phi\|^8) \|\theta\|_{H^3}^2 + 4\epsilon \|\Delta\mathbf{u}\|^2 \\ & + C(\|\mathbf{u}\|^2 + \|\nabla\phi\|^2 + 1)(\|\nabla\mathbf{u}\|^4 + \|\Delta\phi - W'(\phi)\|^4 + \|\theta_t\|^4) \\ & + C(\|\nabla\theta\|^8 + \|\nabla\phi\|^{16} + 1), \end{aligned} \quad (4.26)$$

and

$$\frac{1}{2} \frac{d}{dt} \|\theta_t\|^2 + (\underline{\kappa} - 3\epsilon) \|\nabla\theta_t\|^2 \leq \epsilon^3 \|\mathbf{u}_t\|^2 + C(\|\theta_t\|^4 + \|\Delta\theta\|^4), \quad (4.27)$$

where $\epsilon \in (0, 1)$ is an arbitrary small constant; the constant C_3 may depend on Ω, λ_0, b and $\|\theta_0\|_{L^\infty}$, but not on ϵ and t ; the constant C may depend on $\Omega, \|\phi_0\|_{L^\infty}, \|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)}, \|\theta_0\|_{L^\infty}, \epsilon$ and coefficients of the system, but not on t .

Proof. First, we try to re-estimate the terms K_1, \dots, K_4 in (3.28) and the terms K_5, K_6, K_7 in (3.31), respectively. Let $\epsilon \in (0, 1)$ be an arbitrary small constant. Using Lemma 3.4 and the Gagliardo–Nirenberg inequality ($n = 2$), we have

$$\begin{aligned} K_1 & \leq \|\mathbf{u}_t\| \|\mathbf{u}\|_{\mathbf{L}^4} \|\nabla\mathbf{u}\|_{\mathbf{L}^4} \\ & \leq c \|\mathbf{u}_t\| \|\mathbf{u}\|^{\frac{1}{2}} \|\nabla\mathbf{u}\| \|\Delta\mathbf{u}\|^{\frac{1}{2}} \\ & \leq \epsilon \|\mathbf{u}_t\|^2 + \epsilon \|\Delta\mathbf{u}\|^2 + C \|\mathbf{u}\|^2 \|\nabla\mathbf{u}\|^4, \end{aligned}$$

$$\begin{aligned} K_2 & \leq c \|\mu'(\theta)\|_{L^\infty} \|\theta_t\| \|\mathcal{D}\mathbf{u}\|_{\mathbf{L}^4}^2 \\ & \leq C \|\theta_t\| \|\nabla\mathbf{u}\| \|\Delta\mathbf{u}\| \\ & \leq \epsilon \|\Delta\mathbf{u}\|^2 + C \|\theta_t\|^2 \|\nabla\mathbf{u}\|^2, \end{aligned}$$

$$\begin{aligned} K_4 & \leq C \|\theta\| \|\mathbf{u}_t\| \leq \epsilon \|\mathbf{u}_t\|^2 + C \|\theta\|_{L^\infty}^2 \\ & \leq \epsilon \|\mathbf{u}_t\|^2 + C. \end{aligned}$$

Concerning K_3 , it follows from the Hölder inequality and Young's inequality that

$$\begin{aligned}
K_3 &\leq \epsilon \|\mathbf{u}_t\|^2 + C \|\nabla \cdot [\lambda(\theta) \nabla \phi \otimes \nabla \phi]\|^2 \\
&\leq \epsilon \|\mathbf{u}_t\|^2 + C \|\lambda'(\theta)\|_{L^\infty} \|\nabla \theta\|_{\mathbf{L}^6}^2 \|\nabla \phi\|_{\mathbf{L}^6}^4 \\
&\quad + C \|\lambda(\theta)\|_{L^\infty}^2 (\|\Delta \phi\|^2 + \|\nabla^2 \phi\|^2) \|\nabla \phi\|_{\mathbf{L}^\infty}^2 \\
&:= \epsilon \|\mathbf{u}_t\|^2 + K_{3a} + K_{3b}.
\end{aligned} \tag{4.28}$$

The term K_{3a} can be estimated by using the Gagliardo–Nirenberg inequality, Lemma 3.3 and Young's inequality such that

$$\begin{aligned}
K_{3a} &\leq C \|\lambda'(\theta)\|_{L^\infty} \|\nabla \theta\|_{\mathbf{L}^6}^2 \|\nabla \phi\|_{\mathbf{L}^6}^4 \\
&\leq C \lambda_0 |b| \|\theta\|_{H^3}^{\frac{2}{3}} \|\nabla \theta\|_{H^3}^{\frac{4}{3}} \|\phi\|_{H^3}^{\frac{4}{3}} \|\nabla \phi\|_{H^3}^{\frac{8}{3}} \\
&\leq C \|\theta\|_{H^3}^{\frac{2}{3}} \|\nabla \theta\|_{H^3}^{\frac{4}{3}} \|\nabla \phi\|_{H^3}^{\frac{8}{3}} \left(\|\nabla(\Delta \phi - W'(\phi))\| \right. \\
&\quad \left. + \|\Delta \phi - W'(\phi)\| + \|W''(\phi) \nabla \phi\| + \|W'(\phi)\| + \|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)} + \|\phi\| \right)^{\frac{4}{3}} \\
&\leq \epsilon \|\nabla(\Delta \phi - W'(\phi))\|^2 + (\epsilon + C_3 \epsilon^{-2} \|\nabla \theta\|^4 \|\nabla \phi\|^8) \|\theta\|_{H^3}^2 \\
&\quad + C \|\Delta \phi - W'(\phi)\|^4 + C(\|\nabla \theta\|^8 + \|\nabla \phi\|^{16} + 1),
\end{aligned}$$

where the constant $C_3 > 0$ depends on Ω , λ_0 and $|b|$, but not on ϵ .

For the term K_{3b} , using Lemma 3.4, Agmon's inequality ($n = 2$) and Young's inequality, we get

$$\begin{aligned}
K_{3b} &\leq C(1 + \|\theta\|_{L^\infty}^2) \|\phi\|_{H^2}^2 \|\nabla \phi\| \|\nabla \phi\|_{\mathbf{H}^2} \\
&\leq C(\|\Delta \phi - W'(\phi)\|^2 + \|W'(\phi)\|^2 + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}^2 + \|\phi\|^2) \|\nabla \phi\| \left(\|\nabla(\Delta \phi - W'(\phi))\| \right. \\
&\quad \left. + \|\Delta \phi - W'(\phi)\| + \|W''(\phi) \nabla \phi\| + \|W'(\phi)\| + \|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)} + \|\phi\| \right) \\
&\leq \epsilon \|\nabla(\Delta \phi - W'(\phi))\|^2 + C \|\nabla \phi\|^2 \|\Delta \phi - W'(\phi)\|^4 \\
&\quad + C(\|\Delta \phi - W'(\phi)\|^4 + \|\nabla \phi\|^4 + 1).
\end{aligned}$$

Next, K_5 can be simply estimated in the following way

$$\begin{aligned}
K_5 &\leq \gamma \|W''(\phi)\|_{L^\infty} \|\Delta \phi - W'(\phi)\|^2 \\
&\leq C \|\Delta \phi - W'(\phi)\|^2,
\end{aligned}$$

while for K_6 , using integration by parts and the incompressibility condition for \mathbf{u} , we have

$$\begin{aligned}
K_6 &= 2 \int_{\Omega} \nabla(\Delta \phi - W'(\phi)) \cdot (\nabla \mathbf{u} \nabla \phi) dx \\
&\leq C \|\nabla(\Delta \phi - W'(\phi))\| \|\nabla \mathbf{u}\|_{\mathbf{L}^4} \|\nabla \phi\|_{\mathbf{L}^4} \\
&\leq \epsilon \|\nabla(\Delta \phi - W'(\phi))\|^2 + C \|\nabla \mathbf{u}\| \|\Delta \mathbf{u}\| \|\nabla \phi\| \\
&\quad \times (\|\Delta \phi - W'(\phi)\| + \|W'(\phi)\| + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)} + \|\phi\|) \\
&\leq \epsilon \|\Delta \mathbf{u}\|^2 + \epsilon \|\nabla(\Delta \phi - W'(\phi))\|^2 \\
&\quad + C \|\nabla \phi\|^2 (\|\nabla \mathbf{u}\|^2 + \|\nabla \mathbf{u}\|^4 + \|\Delta \phi - W'(\phi)\|^4).
\end{aligned}$$

Similarly,

$$K_7 \leq \|\Delta \mathbf{u}\| \|\nabla \phi\|_{\mathbf{L}^4} \|\Delta \phi - W'(\phi)\|_{L^4}$$

$$\begin{aligned}
&\leq \epsilon \|\Delta \mathbf{u}\|^2 + C \|\nabla(\Delta \phi - W'(\phi))\| \|\Delta \phi - W'(\phi)\| \|\nabla \phi\| \\
&\quad \times (\|\Delta \phi - W'(\phi)\| + \|W'(\phi)\| + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)} + \|\phi\|) \\
&\leq \epsilon \|\Delta \mathbf{u}\|^2 + \epsilon \|\nabla(\Delta \phi - W'(\phi))\|^2 \\
&\quad + C \|\nabla \phi\|^2 (\|\Delta \phi - W'(\phi)\|^4 + \|\Delta \phi - W'(\phi)\|^2).
\end{aligned}$$

Collecting the above estimates together, we infer from (3.28), (3.31) and Young's inequality that the differential inequality (4.26) holds.

Finally, we re-estimate the terms K_{11} , K_{12} , K_{13} in the inequality (3.35). First we recall that $K_{13} = 0$. Then using the Sobolev embedding theorem, (4.3) and Lemma 3.4, we get

$$\begin{aligned}
K_{11} &\leq \|\kappa'(\theta)\|_{L^\infty} \|\nabla \theta_t\| \|\theta_t\|_{L^4} \|\nabla \theta\|_{L^4} \\
&\leq \epsilon \|\nabla \theta_t\|^2 + c \|\kappa'(\theta)\|_{L^\infty}^2 \|\nabla \theta_t\| \|\theta_t\| \|\Delta \theta\| \|\theta\|_{L^\infty} \\
&\leq 2\epsilon \|\nabla \theta_t\|^2 + C \|\theta_t\|^2 \|\Delta \theta\|^2,
\end{aligned}$$

and

$$\begin{aligned}
K_{12} &\leq \|\mathbf{u}_t\| \|\nabla \theta\|_{L^4} \|\theta_t\|_{L^4} \\
&\leq \epsilon^3 \|\mathbf{u}_t\|^2 + C \epsilon^{-3} \|\Delta \theta\| \|\theta\|_{L^\infty} \|\nabla \theta_t\| \|\theta_t\| \\
&\leq \epsilon^3 \|\mathbf{u}_t\|^2 + \epsilon \|\nabla \theta_t\|^2 + C \|\theta_t\|^2 \|\Delta \theta\|^2.
\end{aligned}$$

As a consequence, we can conclude the differential inequality (4.27) from the above estimates, (3.35) and Young's inequality. The proof is complete. \square

Now we proceed to derive global higher-order estimates for $(\mathbf{u}, \phi, \theta)$.

Proposition 4.3. *Let $n = 2$. Suppose that $(\mathbf{u}, \phi, \theta)$ is a smooth solution to problem (1.3)–(1.8).*

(1) If $|\phi_0| \leq 1$ in Ω , $|\phi_b| \leq 1$ on Γ and θ_0 satisfies $\|\theta_0\|_{L^\infty} \leq \Theta_1$, then for arbitrary but fixed $T \in (0, +\infty)$, we have the following estimates

$$\|\mathbf{u}\|_{\mathbf{V}} + \|\phi\|_{H^2} + \|\theta\|_{H^2} + \|\phi_t\| + \|\theta_t\| \leq C_T, \quad \forall t \in [0, T], \quad (4.29)$$

$$\int_0^T \left(\|\mathbf{u}\|_{\mathbf{H}^2}^2 + \|\phi\|_{H^3}^2 + \|\theta\|_{H^3}^2 + \|\mathbf{u}_t\|^2 + \|\phi_t\|_{H^1}^2 + \|\theta_t\|_{H^1}^2 \right) dt \leq C_T, \quad (4.30)$$

where C_T is a constant depending on Ω , $\|\mathbf{u}_0\|_{\mathbf{V}}$, $\|\phi_0\|_{H^2}$, $\|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)}$, $\|\theta_0\|_{H^2}$, the coefficients of the system as well as T .

(2) If $|\phi_0| \leq 1$ in Ω , $|\phi_b| \leq 1$ on Γ and θ_0 satisfies $\|\theta_0\|_{L^\infty} \leq \Theta_2$, then we have

$$\|\mathbf{u}\|_{\mathbf{V}} + \|\phi\|_{H^2} + \|\theta\|_{H^2} + \|\phi_t\| + \|\theta_t\| \leq C, \quad \forall t \geq 0, \quad (4.31)$$

$$\int_0^T \left(\|\mathbf{u}\|_{\mathbf{H}^2}^2 + \|\phi\|_{H^3}^2 + \|\theta\|_{H^3}^2 + \|\mathbf{u}_t\|^2 + \|\phi_t\|_{H^1}^2 + \|\theta_t\|_{H^1}^2 \right) dt \leq C_T, \quad (4.32)$$

where $T \in (0, +\infty)$ and the constant C in (4.31) is independent of t . Moreover, the following decay property holds

$$\lim_{t \rightarrow +\infty} (\|\mathbf{u}(t)\|_{\mathbf{V}} + \|\Delta \phi(t) - W'(\phi(t))\| + \|\theta(t)\|_{H^2}) = 0. \quad (4.33)$$

Proof. In order to make use of the differential inequalities obtained in Lemma 4.4, the key point is to treat the quantities $\|\Delta\theta\|$, $\|\theta\|_{H^3}$ and $\|\Delta\mathbf{u}\|$ on the right-hand side of (4.26) and (4.27), which involve higher-order spatial derivatives. In the subsequent proof, let $\epsilon \in (0, 1)$ be the same small constant as in Lemma 4.4. We consider two cases in which the initial temperature θ_0 satisfies different constraints on its L^∞ -norm.

Case 1. Suppose $\|\theta_0\|_{L^\infty} \leq \Theta_1$.

In this case, we have global lower-order estimates for $(\mathbf{u}, \phi, \theta)$ as in (4.10) (see Proposition 4.1). Below we use C_i for constants that may depend on $\|\mathbf{u}_0\|$, $\|\phi_0\|_{H^1 \cap L^\infty}$, $\|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)}$, $\|\theta_0\|_{H^2}$, Ω , coefficients of the system and possibly the time T , but they are independent of the parameter ϵ .

Applying the elliptic regularity theorem to equation (3.6) for the transformed temperature ϑ , using the Sobolev embedding theorem, Agmon's inequality ($n = 2$), the Poincaré inequality and Young's inequality, we have

$$\begin{aligned}
\|\vartheta\|_{H^3} &\leq c(\|\chi'(\vartheta)(\vartheta_t + \mathbf{u} \cdot \nabla \vartheta)\|_{H^1} + \|\vartheta\|) \\
&\leq c\|\chi'(\vartheta)\|_{L^\infty} \|\vartheta_t + \mathbf{u} \cdot \nabla \vartheta\|_{H^1} + c\|\nabla \chi'(\vartheta)\|_{L^\infty} \|\vartheta_t + \mathbf{u} \cdot \nabla \vartheta\| + c\|\vartheta\| \\
&\leq c\underline{\kappa}^{-1}(\|\vartheta_t\|_{H^1} + \|\mathbf{u}\|_{L^4} \|\nabla \vartheta\|_{L^4} + \|\nabla \mathbf{u}\|_{L^4} \|\nabla \vartheta\|_{L^4} + \|\mathbf{u}\|_{L^4} \|\nabla^2 \vartheta\|_{L^4}) \\
&\quad + c\left\|\frac{\kappa'(\theta)}{\kappa(\theta)^3}\right\|_{L^\infty} \|\nabla \theta\|_{L^\infty} (\|\vartheta_t\| + \|\mathbf{u}\|_{L^4} \|\nabla \theta\|_{L^4}) + c\|\vartheta\| \\
&\leq c\underline{\kappa}^{-1} \|\nabla \vartheta_t\| + C\|\nabla \mathbf{u}\|^{\frac{1}{2}} \|\mathbf{u}\|^{\frac{1}{2}} \|\Delta \vartheta\|^{\frac{1}{2}} \|\nabla \vartheta\|^{\frac{1}{2}} \\
&\quad + C\|\Delta \mathbf{u}\|^{\frac{1}{2}} \|\nabla \mathbf{u}\|^{\frac{1}{2}} \|\Delta \vartheta\|^{\frac{1}{2}} \|\nabla \theta\|^{\frac{1}{2}} + C\|\nabla \mathbf{u}\|^{\frac{1}{2}} \|\mathbf{u}\|^{\frac{1}{2}} \|\vartheta\|_{H^3}^{\frac{1}{2}} \|\Delta \vartheta\|^{\frac{1}{2}} \\
&\quad + C\|\vartheta\|_{H^3}^{\frac{1}{2}} \|\nabla \vartheta\|^{\frac{1}{2}} (\|\vartheta_t\| + \|\nabla \mathbf{u}\|^{\frac{1}{2}} \|\mathbf{u}\|^{\frac{1}{2}} \|\Delta \vartheta\|^{\frac{1}{2}} \|\nabla \vartheta\|^{\frac{1}{2}}) + c\|\vartheta\| \\
&\leq \frac{1}{2} \|\vartheta\|_{H^3} + c\underline{\kappa}^{-1} \|\nabla \vartheta_t\| + \frac{1}{2} \epsilon^{\frac{3}{2}} \|\Delta \mathbf{u}\| + C\|\nabla \mathbf{u}\| \|\mathbf{u}\| + C\|\Delta \vartheta\| \|\nabla \vartheta\| \\
&\quad + C\|\Delta \vartheta\| \|\nabla \vartheta\| \|\nabla \mathbf{u}\| + C\|\Delta \vartheta\| \|\nabla \mathbf{u}\| \|\mathbf{u}\| + C\|\vartheta_t\|^2 \|\nabla \vartheta\| \\
&\quad + C\|\Delta \vartheta\| \|\nabla \vartheta\|^2 \|\nabla \mathbf{u}\| \|\mathbf{u}\| + C\|\vartheta\|, \tag{4.34}
\end{aligned}$$

where the constant C may depend on Ω , $\|\theta_0\|_{L^\infty}$, ϵ and coefficients of the system, but it is independent of t .

By Proposition 4.1 and the estimates (4.10), (4.13), we infer from (3.16) that

$$\|\Delta \vartheta\| \leq C\|\theta_t\| + C_T \|\nabla \mathbf{u}\|,$$

which together with (4.34) and Young's inequality yields that

$$\|\vartheta\|_{H^3} \leq C_4 \|\nabla \theta_t\| + \epsilon^{\frac{3}{2}} \|\Delta \mathbf{u}\| + C_T (\|\nabla \mathbf{u}\|^2 + \|\theta_t\|^2) + C_T, \tag{4.35}$$

where the constant C_4 may depend on Ω , $\|\theta_0\|_{L^\infty}$ and coefficients of the system, but independent of ϵ and t , while the constant C_T may depend on ϵ , Ω , $\|\mathbf{u}_0\|$, $\|\phi_0\|_{H^1 \cap L^\infty}$, $\|\theta_0\|_{H^1 \cap L^\infty}$, coefficients of the system and T . As a consequence, we deduce from (4.35), the Gagliardo–Nirenberg inequality, the relations (3.10) and (3.12) that

$$\|\Delta \theta\| \leq C\|\theta_t\| + C_T \|\nabla \mathbf{u}\|, \tag{4.36}$$

$$\begin{aligned}
\|\theta\|_{H^3} &\leq C(\|\vartheta\|_{H^3} + \|\vartheta\|_{H^3}^{\frac{1}{2}} \|\Delta \vartheta\| \|\nabla \vartheta\|^{\frac{1}{2}} + \|\vartheta\|_{H^3} \|\nabla \vartheta\|^2 + \|\Delta \vartheta\|) \\
&\leq C_T \|\vartheta\|_{H^3} + C_T (\|\Delta \vartheta\|^2 + \|\Delta \vartheta\|) \\
&\leq \frac{1}{2} C_5^{\frac{1}{2}} \|\nabla \theta_t\| + \frac{1}{2} C_6^{\frac{1}{2}} \epsilon^{\frac{3}{2}} \|\Delta \mathbf{u}\| + C_T (\|\nabla \mathbf{u}\|^2 + \|\theta_t\|^2) + C_T, \tag{4.37}
\end{aligned}$$

where the constants C_5, C_6 may depend on $\|\mathbf{u}_0\|$, $\|\phi_0\|_{H^1 \cap L^\infty}$, $\|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)}$, $\|\theta_0\|_{H^1 \cap L^\infty}$, T , but independent of ϵ .

Now it remains to estimate $\|\Delta \mathbf{u}\|$. We set

$$\mathbf{f} = -\mathbf{u}_t - \mathbf{u} \cdot \nabla \mathbf{u} - \nabla \cdot \left[\lambda(\theta) \nabla \phi \otimes \nabla \phi + \lambda(\theta) \left(\frac{1}{2} |\nabla \phi|^2 + W(\phi) \right) \mathbb{I} \right] + \mathbf{g}\theta$$

and write the equation (1.3) as

$$-\nabla \cdot (2\mu(\theta) \mathcal{D}\mathbf{u}) + \nabla P = \mathbf{f}. \quad (4.38)$$

It follows from the definition of \mathbf{f} that

$$\begin{aligned} \|\mathbf{f}\| &\leq \|\mathbf{u}_t\| + \|\mathbf{u}\|_{\mathbf{L}^4} \|\nabla \mathbf{u}\|_{\mathbf{L}^4} + \|\lambda(\theta)\|_{L^\infty} \|\phi\|_{H^2} \|\nabla \phi\| \\ &\quad + \|\lambda'(\theta)\|_{L^\infty} \|\nabla \theta\|_{\mathbf{L}^3} \|\nabla \phi\|_{\mathbf{L}^3}^2 + \|\lambda'(\theta)\|_{L^\infty} \|\nabla \theta\| \|W(\phi)\|_{L^\infty} \\ &\quad + \|\lambda(\theta)\|_{L^\infty} \|W'(\phi)\|_{L^\infty} \|\nabla \phi\| + C\|\theta\|. \end{aligned}$$

Then by Proposition 4.1, (4.36) and the elliptic estimate

$$\|\phi\|_{H^2} \leq C(\|\Delta \phi - W'(\phi)\| + \|W'(\phi)\| + \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)} + \|\phi\|),$$

we obtain

$$\begin{aligned} \|\mathbf{f}\| &\leq \|\mathbf{u}_t\| + C\|\mathbf{u}\|^{\frac{1}{2}} \|\Delta \mathbf{u}\|^{\frac{1}{2}} \|\nabla \mathbf{u}\| + C\|\phi\|_{H^2} \|\nabla \phi\| \\ &\quad + C\|\Delta \theta\|^{\frac{1}{3}} \|\nabla \theta\|^{\frac{2}{3}} \|\phi\|_{H^2}^{\frac{2}{3}} \|\nabla \phi\|^{\frac{4}{3}} + C_T \\ &\leq \epsilon_1 \|\Delta \mathbf{u}\| + \|\mathbf{u}_t\| + C_T \|\nabla \mathbf{u}\|^2 + C_T (\|\Delta \phi - W'(\phi)\| + \|\Delta \theta\| + 1) \\ &\leq \epsilon_1 \|\Delta \mathbf{u}\| + \|\mathbf{u}_t\| + C_T (\|\nabla \mathbf{u}\|^2 + \|\theta_t\| + \|\Delta \phi - W'(\phi)\| + 1), \end{aligned}$$

where $\epsilon_1 > 0$ is an arbitrary small constant (independent of ϵ).

It follows from the estimate (4.10) and the Sobolev embedding theorem ($n = 2$) that $\|\mathbf{u}\|_{L^4(0,T;\mathbf{L}^4(\Omega))} \leq C_T$. Since $H^2(\Omega) \hookrightarrow C^\alpha(\overline{\Omega})$ with $\alpha \in (0, 1)$ when $n = 2$, we infer from Lemma 4.3 that $[\theta]_{C^{\frac{\delta}{2},\delta}} \leq C_T$ for some $\delta \in (0, \alpha)$. Due to this Hölder estimate for θ , we are able to apply Lemma 4.2 to the Stokes equation (4.38) and deduce from the estimates (4.24)–(4.25) that

$$\begin{aligned} &\|\Delta \mathbf{u}\| + \|\nabla P\| \\ &\leq C\|\mathbf{f}\| + C\|\mu(\theta)\|_{H^1} \|\mu(\theta)\|_{H^2} \|\nabla \mathbf{u}\| + C\|P\| \\ &\leq C\epsilon_1 \|\Delta \mathbf{u}\| + C\|\mathbf{u}_t\| + C_T \|\nabla \mathbf{u}\|^2 + C_T (\|\Delta \theta\| + \|\nabla \theta\|_{\mathbf{L}^4}^2) \|\nabla \mathbf{u}\| \\ &\quad + C_T (\|\nabla \mathbf{u}\| + \|\theta_t\| + \|\Delta \phi - W'(\phi)\|) + C_T \\ &\leq C\epsilon_1 \|\Delta \mathbf{u}\| + C\|\mathbf{u}_t\| + C_T (\|\nabla \mathbf{u}\|^2 + \|\theta_t\|^2 + \|\Delta \phi - W'(\phi)\|^2) + C_T, \end{aligned}$$

where the constant C only depends on Ω and $\|\theta_0\|_{H^2}$, but not on ϵ_1 . Then taking ϵ_1 in the above inequality sufficiently small, we have

$$\|\Delta \mathbf{u}\| \leq \frac{1}{2} C_7^{\frac{1}{2}} \|\mathbf{u}_t\| + C_T (\|\nabla \mathbf{u}\|^2 + \|\theta_t\|^2 + \|\Delta \phi - W'(\phi)\|^2 + 1), \quad (4.39)$$

where the constant C_7 only depends on Ω and $\|\theta_0\|_{H^2}$.

Let $\eta > 0$ be a constant (not necessary small) that will be determined later (see (4.42) below). We introduce the quantity

$$\mathcal{Y}(t) := 2 \int_{\Omega} \mu(\theta) |\mathcal{D}\mathbf{u}|^2 dx + \|\Delta \phi - W'(\phi)\|^2 + \eta \|\theta_t\|^2. \quad (4.40)$$

Multiplying the differential inequality (4.27) by η and adding the resultant with (4.26) (see Lemma 4.4), using Proposition 4.1, the estimates (4.36), (4.37), (4.39) and the fact $\epsilon \in (0, 1)$, we obtain that

$$\begin{aligned}
& \frac{1}{2} \frac{d}{dt} \mathcal{Y}(t) + (1 - 3\epsilon) \|\mathbf{u}_t\|^2 + (\gamma - 4\epsilon) \|\nabla(\Delta\phi - W'(\phi))\|^2 \\
& \quad + \eta(\underline{\kappa} - 3\epsilon) \|\nabla\theta_t\|^2 \\
\leq & \eta\epsilon^3 \|\mathbf{u}_t\|^2 + (\epsilon + C_8\epsilon^{-2}) (C_5 \|\nabla\theta_t\|^2 + C_6\epsilon^3 \|\Delta\mathbf{u}\|^2) + 4\epsilon \|\Delta\mathbf{u}\|^2 \\
& \quad + C_T (\|\nabla\mathbf{u}\|^4 + \|\Delta\phi - W'(\phi)\|^4 + \|\theta_t\|^4) + C_T \\
\leq & \left[\eta\epsilon^2 + \frac{1}{2} C_6 C_7 (\epsilon^3 + C_8) + 2C_7 \right] \epsilon \|\mathbf{u}_t\|^2 + (\epsilon + C_8\epsilon^{-2}) C_5 \|\nabla\theta_t\|^2 \\
& \quad + C_T (\|\nabla\mathbf{u}\|^4 + \|\Delta\phi - W'(\phi)\|^4 + \|\theta_t\|^4) + C_T \\
\leq & (\eta\epsilon^2 + C_9) \epsilon \|\mathbf{u}_t\|^2 + C_{10}\epsilon^{-2} \|\nabla\theta_t\|^2 \\
& \quad + C_T (\|\nabla\mathbf{u}\|^4 + \|\Delta\phi - W'(\phi)\|^4 + \|\theta_t\|^4) + C_T,
\end{aligned} \tag{4.41}$$

where the constants C_9 and C_{10} do not depend on ϵ and η .

For arbitrary but fixed $T \in (0, +\infty)$, on the time interval $[0, T]$, we shall properly choose the constants $\epsilon \in (0, 1)$ and $\eta > 0$ in the differential inequality (4.41) such that the following relations are satisfied

$$\begin{cases} 1 - 3\epsilon - (\eta\epsilon^2 + C_9)\epsilon \geq \frac{1}{2}, \\ \gamma - 4\epsilon \geq \frac{\gamma}{2}, \\ \eta(\underline{\kappa} - 3\epsilon) - C_{10}\epsilon^{-2} = \frac{\eta\underline{\kappa}}{2}. \end{cases}$$

One can verify that a possible choice for ϵ, η is as follows

$$\begin{cases} 0 < \epsilon \leq \min \left\{ \frac{1}{8}, \frac{\gamma}{8}, \frac{\underline{\kappa}}{12}, \frac{\underline{\kappa}}{8(4C_{10} + C_9\underline{\kappa})} \right\}, \\ \eta = \frac{2C_{10}}{(\underline{\kappa} - 6\epsilon)\epsilon^2}. \end{cases} \tag{4.42}$$

After fixing the constants ϵ and η , using the fact $\|\nabla\mathbf{u}\|^2 \leq 2\mu^{-1} \int_{\Omega} \mu(\theta) |\mathcal{D}\mathbf{u}|^2 dx$, we infer from (4.41) that

$$\begin{aligned}
& \frac{d}{dt} \mathcal{Y}(t) + \|\mathbf{u}_t\|^2 + \gamma \|\nabla(\Delta\phi - W'(\phi))\|^2 + \eta\underline{\kappa} \|\nabla\theta_t\|^2 \\
\leq & C_T \mathcal{Y}(t)^2 + C_T.
\end{aligned} \tag{4.43}$$

On the other hand, we infer from Lemma 3.4 and Proposition 4.1 that

$$2 \int_{\Omega} \mu(\theta) |\mathcal{D}\mathbf{u}|^2 dx + \|\Delta\phi - W'(\phi)\|^2 + \|\theta_t\|^2 \in L^1(0, T).$$

Hence, it follows from (4.43) and the Gronwall type inequality in [43, Lemma 6.2.1] that for arbitrary but fixed $T \in (0, +\infty)$,

$$\begin{aligned}
& \sup_{t \in [0, T]} \left(\int_{\Omega} \mu(\theta) |\mathcal{D}\mathbf{u}|^2 dx + \|\Delta\phi - W'(\phi)\|^2 + \|\theta_t\|^2 \right) \leq C_T, \\
& \int_0^T (\|\mathbf{u}_t\|^2 + \|\nabla(\Delta\phi - W'(\phi))\|^2 + \|\nabla\theta_t\|^2) dt \leq C_T,
\end{aligned}$$

which together with the estimates (4.36), (4.37) and (4.39) yield our conclusions (4.29) and (4.30).

Case 2. Suppose $\|\theta_0\|_{L^\infty} \leq \Theta_2$.

In this case, we can obtain the uniform-in-time estimates (4.21) and (4.22) (see Proposition 4.2) instead of the time-dependent estimates (4.10). Then by corresponding modifications in the argument for Case 1, we can see that for $t > 0$, the following differential inequality holds (comparing with (4.43))

$$\frac{d}{dt}\mathcal{Y}(t) + \|\mathbf{u}_t\|^2 + \gamma\|\nabla(\Delta\phi - W'(\phi))\|^2 + \eta_{\underline{L}}\|\nabla\theta_t\|^2 \leq C\mathcal{Y}(t)^2 + C, \quad (4.44)$$

where C is a constant that depend on Ω , $\|\mathbf{u}_0\|$, $\|\phi_0\|_{H^1 \cap L^\infty}$, $\|\phi_b\|_{H^{\frac{5}{2}}(\Gamma)}$, $\|\theta_0\|_{H^2}$ and coefficients of the system, but not on time t .

Using the uniform-in-time estimate (4.21), we have

$$\begin{aligned} \|\theta_t\| &\leq \|\mathbf{u} \cdot \nabla\theta\| + \|\nabla \cdot (\kappa(\theta)\nabla\theta)\| \\ &\leq \|\mathbf{u}\|_{\mathbf{L}^4}\|\nabla\theta\|_{\mathbf{L}^4} + \|\kappa(\theta)\|_{L^\infty}\|\Delta\theta\| + \|\kappa'(\theta)\|_{L^\infty}\|\nabla\theta\|_{\mathbf{L}^4}^2 \\ &\leq C\|\nabla\mathbf{u}\|^{\frac{1}{2}}\|\Delta\theta\|^{\frac{1}{2}} + C\|\Delta\theta\|(1 + \|\nabla\theta\|) \\ &\leq C(\|\nabla\mathbf{u}\| + \|\Delta\theta\|) \end{aligned} \quad (4.45)$$

where C is independent of t . Then we deduce the L^1 -integrability of $\mathcal{Y}(t)$ on \mathbb{R}^+ from the above estimate and (4.22):

$$\int_0^{+\infty} \mathcal{Y}(t)dt < +\infty. \quad (4.46)$$

Then it follows from (4.44)–(4.46) and the Gronwall type lemma in [43, Lemma 6.2.1] that

$$\sup_{t \geq 0} \mathcal{Y}(t) \leq C \quad \text{and} \quad \lim_{t \rightarrow +\infty} \mathcal{Y}(t) = 0, \quad (4.47)$$

which easy imply the uniform estimates (4.31) and (4.32). By (3.10), we see that

$$\begin{aligned} \|\Delta\theta\| &\leq C(\|\nabla^2\vartheta\| + \|\nabla\vartheta\|_{\mathbf{L}^4}^2) \\ &\leq C(\|\vartheta_t\| + \|\mathbf{u}\|\|\nabla\mathbf{u}\|\|\nabla\vartheta\|)(1 + \|\nabla\vartheta\|) \\ &\leq C(\|\theta_t\| + \|\nabla\mathbf{u}\|), \end{aligned}$$

where the constant C is independent of t . Then (4.45) and (4.47) further indicate that $\lim_{t \rightarrow +\infty} \|\Delta\theta\| = 0$. As a consequence, the decay property (4.33) holds.

The proof of Proposition 4.3 is complete. \square

4.2.2 Proof of Theorem 2.3

Based on the local well-posedness result, the existence of global strong solutions in $2D$ easily follows from the global-in-time *a priori* estimates obtained in Proposition 4.3. Besides, uniqueness of global strong solutions can be proved in the same way as for Theorem 2.1 (see (3.58)). Hence, the details are omitted here.

Remark 4.3. *The continuous dependence estimate (3.58) implies that in the $2D$ case, for any $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{V} \times H^2 \times (H^2 \cap H_0^1)$ we are able to define a closed semigroup $\Sigma(t)$ for $t \geq 0$ in the sense of [31] by setting $(\mathbf{u}(t), \phi(t), (\theta(t))) = \Sigma(t)(\mathbf{u}_0, \phi_0, \theta_0)$, where $(\mathbf{u}, \phi, \theta)$ is the global strong solution to problem (1.3)–(1.8). This observation will enable us to further investigate the associate infinite dimensional dynamical system of problem (1.3)–(1.8), for instance, the existence of a global attractor.*

Remark 4.4. *Since problem (1.3)–(1.8) enjoys an dissipative energy law (4.17) under the assumption $\|\theta_0\|_{L^\infty} \leq \Theta_2$, in addition to the decay property (4.33), we can further prove the convergence of global strong solution to a single steady state $(\mathbf{0}, \phi_\infty, 0)$ as time goes to infinity. Indeed, there exists a function ϕ_∞ satisfying the nonlinear elliptic boundary value problem:*

$$\begin{cases} -\Delta\phi_\infty + W'(\phi_\infty) = 0, & x \in \Omega, \\ \phi_\infty(x) = \phi_b(x), & x \in \Gamma, \end{cases}$$

such that

$$\|\mathbf{u}(t)\|_{\mathbf{V}} + \|\phi(t) - \phi_\infty\|_{H^2} + \|\theta(t)\|_{H^2} \leq C(1+t)^{-\frac{\rho}{(1-2\rho)}}, \quad \forall t \geq 0,$$

where $\rho \in (0, \frac{1}{2})$ is a constant depending on ϕ_∞ . Based on the dissipative energy law (4.17) and the uniform-in-time higher-order estimate (4.31), the proof can be carried out by applying the so-called Łojasiewicz–Simon approach, following the argument in [39]. We leave the details to interested readers.

5 Conclusion

In this paper, we study the well-posedness of a non-isothermal diffuse-interface model proposed in [15, 24, 34] that describes the Marangoni effects in the mixture of two incompressible Newtonian fluids due to the thermo-induced surface tension heterogeneity on the interface. This is an interesting physical phenomenon, and some numerical schemes as well as numerical simulations have been investigated in the recent literature [15, 34]. The first theoretical results concerning well-posedness and long-time behavior of solutions are obtained in [39], in which a simplified version of the system (1.3)–(1.6) with only constant fluid viscosity and thermal diffusivity was considered. Here, we study the more general case such that the surface tension, fluid viscosity and thermal diffusivity are allowed to be temperature dependent. More precisely, for the initial-boundary value problem (1.3)–(1.8), we have proved that (1) for general regular initial data, strong solutions are locally well-posed in both $2D$ and $3D$ (see Theorem 2.1); (2) under the assumption that the L^∞ -norm of initial temperature is bounded only with respect to the coefficients of problem (1.3)–(1.8), global weak solutions exist in $2D$ (see Theorem 2.2); (3) under the same bound on the initial temperature variation, problem (1.3)–(1.8) also admits a unique global strong solution in $2D$ (see Theorem 2.3). We believe that establishing well-posedness property of the diffuse-interface model could be viewed as a useful step towards its validation. On the other hand, our results on the long-term dynamics (see Theorem 2.3 and Remark 4.4) will be helpful for people to understand the complicated nonlinear phenomena and construct suitable numerical schemes. Finally, we expect to extend the results to the case where the phase-field function ϕ satisfies a forth-order Cahn–Hilliard type equation instead of the second-order Allen–Cahn equation. In this case, the mathematical analysis is more challenging due to the loss of maximum principle, which launches an interesting problem for the future study.

6 Appendix

In what follows, we sketch the semi-Galerkin approximate schemes that are used in our previous proofs. They are inspired by [22] on the simplified Ericksen–Leslie system for nematic liquid crystal flows. Furthermore, different schemes will be used for the local strong solutions in both $2D$ and $3D$, and for the global weak solutions in $2D$.

Let the family $\{\mathbf{v}_i\}_{i=1}^\infty$ be a basis of the Hilbert space \mathbf{V} , which is given by eigenfunctions of the Stokes problem

$$(\nabla \mathbf{v}_i, \nabla \mathbf{w}) = \lambda_i(\mathbf{v}_i, \mathbf{w}), \quad \forall \mathbf{w} \in \mathbf{V}, \text{ with } \|\mathbf{v}_i\| = 1,$$

where λ_i is the eigenvalue corresponding to \mathbf{v}_i . It is well-known that $0 < \lambda_1 < \lambda_2 < \dots$ is an unbounded monotonically increasing sequence, $\{\mathbf{v}_i\}_{i=1}^\infty$ forms a complete orthonormal basis in \mathbf{H} and it is also orthogonal in \mathbf{V} (see [36]). In a similar way, let the family $\{w_i\}_{i=1}^\infty$ be the Hilbert basis of $H_0^1(\Omega)$, which is given by the eigenfunctions of the Laplacian

$$-\Delta w_i = \eta_i w_i, \quad w_i|_\Gamma = 0, \quad \text{with } \|w_i\| = 1.$$

Then the eigenvalues $0 < \eta_1 < \eta_2 < \dots$ also form an unbounded monotonically increasing sequence, $\{w_i\}_{i=1}^\infty$ forms a complete orthonormal basis in $L^2(\Omega)$ and it is also orthogonal in $H_0^1(\Omega)$. By the elliptic regularity theory, we have $\mathbf{v}_i \in \mathbf{C}^\infty$ and $w_i \in C^\infty$ for all $i \in \mathbb{N}$.

For every $m \in \mathbb{N}$, we denote by $\mathbf{V}_m = \text{span}\{\mathbf{v}_1, \dots, \mathbf{v}_m\}$ and $W_m = \text{span}\{w_1, \dots, w_m\}$ the finite dimensional subspaces of \mathbf{V} and $H_0^1(\Omega)$ spanned by their first m basis functions, respectively. Moreover, we use Π_m for the orthogonal projection from \mathbf{H} onto \mathbf{V}_m and $\tilde{\Pi}_m$ for the orthogonal projection from $L^2(\Omega)$ onto W_m .

6.1 Semi-Galerkin Approximation Type A: for local strong solutions in both 2D and 3D

For every $m \in \mathbb{N}$ and arbitrary $T > 0$, we consider the following approximate problem (AP1): looking for functions

$$\mathbf{u}^m(t, x) = \sum_{i=1}^m g_i^m(t) \mathbf{v}_i(x), \quad \theta^m(t, x) = \sum_{i=1}^m r_i^m(t) w_i(x),$$

and $\phi^m(t, x)$ such that

$$(AP1) \begin{cases} \langle \mathbf{u}_t^m, \mathbf{v} \rangle_{\mathbf{V}', \mathbf{V}} + \int_\Omega (\mathbf{u}^m \cdot \nabla) \mathbf{u}^m \cdot \mathbf{v} dx + 2 \int_\Omega \mu(\theta^m) \mathcal{D} \mathbf{u}^m : \mathcal{D} \mathbf{v} dx \\ \quad = \int_\Omega [\lambda(\theta^m) \nabla \phi^m \otimes \nabla \phi^m] : \nabla \mathbf{v} dx + \int_\Omega \theta^m \mathbf{g} \cdot \mathbf{v} dx, \quad \forall \mathbf{v} \in \mathbf{V}_m, \\ \phi_t^m + \mathbf{u}^m \cdot \nabla \phi^m + \gamma(-\Delta \phi^m + W'(\phi^m)) = 0, \quad \text{a.e. in } (0, T) \times \Omega, \\ \langle \theta_t^m, w \rangle_{H^{-1}, H_0^1} + \int_\Omega (\mathbf{u}^m \cdot \nabla \theta^m) w dx + \int_\Omega \kappa(\theta^m) \nabla \theta^m \cdot \nabla w dx = 0, \quad \forall w \in W_m, \\ \phi^m = \phi_b, \quad \text{on } (0, T) \times \Gamma, \\ \mathbf{u}^m|_{t=0} = \mathbf{u}_0^m := \Pi_m \mathbf{u}_0, \quad \phi^m|_{t=0} = \phi_0, \quad \theta^m|_{t=0} = \theta_0^m := \tilde{\Pi}_m \theta_0, \quad \text{in } \Omega. \end{cases}$$

Remark 6.1. In problem (AP1), we assume that $\mu(\cdot)$, $\kappa(\cdot)$ are taken in such a way as in subsection 3.1.3 (recall also Remark 3.2).

Proposition 6.1. Suppose $n = 2, 3$. We assume that $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{H} \times (H^1(\Omega) \cap L^\infty(\Omega)) \times H_0^1(\Omega)$, $\phi_b \in H^{\frac{3}{2}}(\Gamma)$ with $\phi_0|_\Gamma = \phi_b$ satisfying $|\phi_0| \leq 1$ a.e. in Ω and $|\phi_b| \leq 1$ on Γ . For every $m \in \mathbb{N}$, there is a time $T_m > 0$ depending on \mathbf{u}_0 , ϕ_0 , θ_0 , m and Ω such that problem (AP1) admits a unique solution on $[0, T_m]$ satisfying $\mathbf{u}^m \in H^1(0, T_m; \mathbf{V}_m)$, $\theta^m \in H^1(0, T_m; W_m)$ and $\phi^m \in L^\infty(0, T_m; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T_m; H^2(\Omega))$. Moreover, if we further assume $\phi_0 \in H^2(\Omega)$ and $\phi_b \in H^{\frac{5}{2}}(\Gamma)$, then $\phi^m \in L^\infty(0, T_m; H^2(\Omega)) \cap L^2(0, T_m; H^3(\Omega))$.

Proof. Let $T > 0$ and $M = 2 + 2\|\mathbf{u}_0\|^2 + 2\|\theta_0\|^2$. Consider arbitrary given functions

$$\mathbf{w}^m(t, x) = \sum_{i=1}^m g_i^m(t) \mathbf{v}_i \in C([0, T]; \mathbf{V}_m), \quad \psi^m(t, x) = \sum_{i=1}^m r_i^m(t) w_i \in C([0, T]; W_m),$$

with

$$g_i^m(0) = (\mathbf{u}_0, \mathbf{v}_i), \quad r_i^m(0) = (\theta_0, w_i), \quad \sup_{t \in [0, T]} \sum_{i=1}^m (|g_i^m(t)|^2 + |r_i^m(t)|^2) \leq M.$$

It is obvious that

$$\sup_{t \in [0, T]} \|\mathbf{w}^m(t, x)\|^2 \leq M, \quad \sup_{t \in [0, T]} \|\mathbf{w}^m(t, x)\|_{\mathbf{L}^\infty}^2 \leq M \max_{1 \leq i \leq m} \|\mathbf{v}_i\|_{\mathbf{L}^\infty}^2 \leq C_m M. \quad (6.1)$$

Step 1. We consider the following semilinear parabolic equation for ϕ^m with convection term under the given velocity \mathbf{w}^m :

$$\begin{cases} \phi_t^m + \mathbf{w}^m \cdot \nabla \phi^m + \gamma(-\Delta \phi^m + W'(\phi^m)) = 0, & \text{a.e. in } (0, T) \times \Omega, \\ \phi^m = \phi_b, & \text{on } (0, T) \times \Gamma, \\ \phi^m|_{t=0} = \phi_0, & \text{for } x \in \Omega, \end{cases} \quad (6.2)$$

Well-posedness of problem (6.2) can be obtained by a standard fixed point argument, similar to the liquid crystal system [7, 22]. Indeed, we have

Lemma 6.1. *Assume that $\mathbf{w}^m \in C([0, T]; \mathbf{V}_m)$, $\phi_0 \in H^1(\Omega) \cap L^\infty(\Omega)$, $\phi_b \in H^{\frac{3}{2}}(\Gamma)$ with $\phi_0|_\Gamma = \phi_b$ satisfying $|\phi_0| \leq 1$ a.e. in Ω and $|\phi_b| \leq 1$ on Γ . Then there exists a unique weak solution $\phi^m \in L^\infty(0, T; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T; H^2(\Omega))$ to problem (6.2) such that $|\phi^m(t, x)| \leq 1$ a.e. in $[0, T] \times \Omega$. Moreover, if $\phi_0 \in H^2(\Omega)$ and $\phi_b \in H^{\frac{5}{2}}(\Gamma)$, then $\phi^m \in L^\infty(0, T; H^2(\Omega)) \cap L^2(0, T; H^3(\Omega))$.*

It is easy to verify that the weak solution ϕ^m satisfies the following energy inequality (see e.g., [22])

$$\begin{aligned} & \frac{d}{dt} \int_{\Omega} \left(\frac{1}{2} |\nabla \phi^m|^2 + W(\phi^m) \right) dx + \gamma \| -\Delta \phi^m + W'(\phi^m) \|^2 \\ &= - \int_{\Omega} (\mathbf{w}^m \cdot \nabla \phi^m) (-\Delta \phi^m + W'(\phi^m)) dx \\ &\leq \frac{\gamma}{2} \| -\Delta \phi^m + W'(\phi^m) \|^2 + \frac{1}{2\gamma} \|\mathbf{w}^m\|_{\mathbf{L}^\infty}^2 \|\nabla \phi^m\|^2 \\ &\leq \frac{\gamma}{2} \| -\Delta \phi^m + W'(\phi^m) \|^2 + \frac{C_m M}{\gamma} \left(\frac{1}{2} \|\nabla \phi^m\|^2 + \int_{\Omega} W(\phi^m) dx \right), \end{aligned} \quad (6.3)$$

where in the last step we have used (6.1). Then by the Gronwall inequality, it follows that

$$\begin{aligned} & \sup_{t \in [0, T]} \int_{\Omega} \left(\frac{1}{2} |\nabla \phi^m|^2 + W(\phi^m) \right) dx + \frac{\gamma}{2} \int_0^T \| -\Delta \phi^m + W'(\phi^m) \|^2 dt \\ &\leq \left(\frac{1}{2} \|\nabla \phi_0\|^2 + \int_{\Omega} W(\phi_0) dx \right) (\gamma^{-1} C_m M T + 1) e^{\gamma^{-1} C_m M T}, \end{aligned} \quad (6.4)$$

which together with the weak maximum principle Lemma 3.3 and the elliptic regularity theorem yields

$$\sup_{t \in [0, T]} \|\phi^m(t)\|_{H^1}^2 + \int_0^T \|\phi^m(t)\|_{H^2}^2 dt$$

$$\leq K(\|\phi_0\|_{H^1}, \|\phi_b\|_{H^{\frac{3}{2}}(\Gamma)}, \gamma, T, M, m) := K. \quad (6.5)$$

We note that the constant K on the right-hand side of (6.5) can be chosen independent of T if $T \in (0, 1]$. Besides, for the semilinear parabolic equation (6.2), it is easy to prove the continuous dependence on the initial data as well as the given velocity field \mathbf{w}^m . Therefore, the solution operator defined by problem (6.2)

$$\Phi^m : C([0, T]; \mathbf{V}_m) \times C([0, T]; W_m) \rightarrow L^\infty(0, T; H^1(\Omega)) \cap L^2(0, T; H^2(\Omega))$$

such that $\phi^m = \Phi^m(\mathbf{w}^m, \psi^m)$, is continuous (indeed Φ^m does not depend on ψ^m).

Step 2. Once ϕ^m is determined, we turn to look for functions

$$\mathbf{u}^m(t, x) = \sum_{i=1}^m \tilde{g}_i^m(t) \mathbf{v}_i, \quad \theta^m(t, x) = \sum_{i=1}^m \tilde{r}_i^m(t) w_i,$$

that satisfy the following system, for $i = 1, \dots, m$,

$$\begin{cases} \langle \mathbf{u}_t^m, \mathbf{v}_i \rangle_{\mathbf{V}', \mathbf{V}} + \int_{\Omega} (\mathbf{u}^m \cdot \nabla) \mathbf{u}^m \cdot \mathbf{v}_i dx + 2 \int_{\Omega} \mu(\theta^m) \mathcal{D} \mathbf{u}^m : \mathcal{D} \mathbf{v}_i dx \\ \quad = \int_{\Omega} [\lambda(\theta^m) \nabla \phi^m \otimes \nabla \phi^m] : \nabla \mathbf{v}_i dx + \int_{\Omega} \theta^m \mathbf{g} \cdot \mathbf{v}_i dx, \\ \langle \theta_t^m, w_i \rangle_{H^{-1}, H_0^1} + \int_{\Omega} (\mathbf{u}^m \cdot \nabla \theta^m) w_i dx + \int_{\Omega} \kappa(\theta^m) \nabla \theta^m \cdot \nabla w_i dx = 0, \\ \mathbf{u}^m|_{t=0} = \Pi_m \mathbf{u}_0, \quad \theta^m|_{t=0} = \tilde{\Pi}_m \theta_0, \quad \text{in } \Omega, \end{cases} \quad (6.6)$$

which is equivalent to a system consisting of $2m$ nonlinear ordinary differential equations for the coefficients $\{\tilde{g}_i^m(t)\}_{i=1}^m$ and $\{\tilde{r}_i^m(t)\}_{i=1}^m$. Due to our assumptions on the smoothness of λ , κ and μ , it is standard to show the local well-posedness of the above initial problem using the classical theory of ODEs (see, e.g., [27, 43]). Namely, we have

Lemma 6.2. *Let $\phi^m \in L^\infty(0, T; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T; H^2(\Omega))$. Assume that $\mathbf{u}_0 \in \mathbf{H}$, $\theta_0 \in H_0^1(\Omega)$, then problem (6.6) admits a unique solution on $[0, T_1]$ such that $\mathbf{u}^m(t, x) = \sum_{i=1}^m \tilde{g}_i^m(t) \mathbf{v}_i \in H^1(0, T_1; \mathbf{V}_m)$, $\theta^m(t, x) = \sum_{i=1}^m \tilde{r}_i^m(t) w_i \in H^1(0, T_1; W_m)$, where $T_1 \in (0, T]$ may depend on M , ϕ^m and m .*

In particular, recalling subsection 3.1.3 and Remark 3.2, the following estimates hold for \mathbf{u}^m and θ^m :

$$\frac{1}{2} \frac{d}{dt} \|\theta^m\|^2 + \int_{\Omega} \kappa(\theta^m) |\nabla \theta^m|^2 dx = - \int_{\Omega} (\mathbf{u}^m \cdot \nabla \theta^m) \theta^m dx = 0$$

and

$$\begin{aligned} & \frac{1}{2} \frac{d}{dt} \|\mathbf{u}^m\|^2 + 2 \int_{\Omega} \mu(\theta^m) |\mathcal{D} \mathbf{u}^m|^2 dx \\ &= \int_{\Omega} [\lambda(\theta^m) \nabla \phi^m \otimes \nabla \phi^m] : \nabla \mathbf{u}^m dx + \int_{\Omega} \theta^m \mathbf{g} \cdot \mathbf{u}^m dx \\ &\leq C(1 + \|\theta^m\|_{L^\infty}) \|\nabla \phi^m\|^2 \|\nabla \mathbf{u}^m\|_{\mathbf{L}^\infty} + C \|\theta^m\| \|\nabla \mathbf{u}^m\| \\ &\leq \frac{\mu}{2} \|\nabla \mathbf{u}^m\|^2 + \frac{C_m}{\underline{\mu}} \|\nabla \phi^m\|^4 (1 + \|\theta^m\|^2) + \frac{C}{\underline{\mu}} \|\theta^m\|^2, \end{aligned} \quad (6.7)$$

where we have used the inverse inequalities $\|\theta^m\|_{L^\infty} \leq C_m \|\theta^m\|$ and $\|\nabla \mathbf{u}^m\|_{\mathbf{L}^\infty} \leq C_m \|\nabla \mathbf{u}^m\|$ because (\mathbf{u}^m, θ^m) is indeed finite dimensional. By the fact $2\|\mathcal{D} \mathbf{u}^m\|^2 = \|\nabla \mathbf{u}^m\|^2$ and the Gronwall inequality, we obtain

$$\sup_{t \in [0, T_1]} \|\theta^m(t)\|^2 + 2\underline{\kappa} \int_0^{T_1} \|\nabla \theta^m\|^2 dt \leq \|\theta_0\|^2, \quad (6.8)$$

$$\begin{aligned}
& \sup_{t \in [0, T_1]} \|\mathbf{u}^m(t)\|^2 + \underline{\mu} \int_0^{T_1} \|\nabla \mathbf{u}^m\|^2 dt \\
& \leq \|\mathbf{u}_0\|^2 + \frac{C_m}{\underline{\mu}} T_1 (1 + \|\theta_0\|^2) \sup_{t \in [0, T_1]} \|\nabla \phi^m\|^4 + \frac{C}{\underline{\mu}} T_1 \|\theta_0\|^2.
\end{aligned} \tag{6.9}$$

Since ϕ^m is bounded in $L^\infty(0, T_1; H^1(\Omega)) \cap L^2(0, T_1; H^2(\Omega))$, inserting it back to the ODE system (6.6), we can further deduce that $\tilde{g}_i^m(t), \tilde{r}_i^m(t) \in H^1(0, T_1)$ and thus \mathbf{u}^m and θ^m are bounded in $H^1(0, T_1; \mathbf{V}_m)$ and $H^1(0, T_1; W_m)$, respectively, by a constant that depends on M, m . Besides, for the ODE system (6.6), it is easy to prove the continuous dependence on its initial data and the given function ϕ^m . As a consequence, the solution operator defined by problem (6.6)

$$\Psi^m : L^\infty(0, T_1; H^1(\Omega)) \cap L^2(0, T_1; H^2(\Omega)) \rightarrow H^1(0, T_1; \mathbf{V}_m) \times H^1(0, T_1; W_m)$$

such that $(\mathbf{u}^m, \theta^m) = \Psi^m(\phi^m)$, is continuous.

Step 3. We now prove the existence of solutions to problem (AP1) for sufficiently short time intervals. From the previous steps, we can see that the operator

$$\Psi^m \circ \Phi^m : C([0, T_1]; \mathbf{V}_m) \times C([0, T_1]; W_m) \rightarrow H^1(0, T_1; \mathbf{V}_m) \times H^1(0, T_1; W_m)$$

such that $\Psi^m \circ \Phi^m(\mathbf{w}^m, \psi^m) = (\mathbf{u}^m, \theta^m)$, is continuous, where (\mathbf{u}^m, θ^m) is the solution to problem (6.6). Moreover, the compactness of $H^1(0, T_1; \mathbf{V}_m) \times H^1(0, T_1; W_m)$ into $C([0, T_1]; \mathbf{V}_m) \times C([0, T_1]; W_m)$ (because \mathbf{V}_m and W_m are actually finite dimensional spaces) implies that $\Psi^m \circ \Phi^m$ is an compact operator from $C([0, T_1]; \mathbf{V}_m) \times C([0, T_1]; W_m)$ into itself. Finally, due to our choice of M and the estimates (6.5), (6.8), (6.9), it holds

$$\sup_{t \in [0, T_1]} (\|\mathbf{u}^m(t)\|^2 + \|\theta^m(t)\|^2) \leq \frac{M}{2} + \frac{T_1}{2\underline{\mu}} (C_m M K^2 + C M). \tag{6.10}$$

Hence, we can take $T_m \in (0, T_1)$ to be sufficiently small such that $\|\mathbf{u}^m(t)\|^2 + \|\theta^m(t)\| \leq M$ for all $t \in [0, T_m]$.

We are ready to apply the Schauder's fixed point theorem to conclude that there exists at least one fixed point (\mathbf{u}^m, θ^m) in the bounded closed convex set

$$\begin{aligned}
& \left\{ (\mathbf{u}^m, \theta^m) \in C([0, T_m]; \mathbf{V}_m \times W_m) \mid \sup_{t \in [0, T_m]} (\|\mathbf{u}^m(t)\|^2 + \|\theta^m(t)\|^2) \leq M, \right. \\
& \quad \left. \text{with } \mathbf{u}^m(0) = \Pi_m \mathbf{u}_0, \theta^m(0) = \tilde{\Pi}_m \theta_0. \right\}
\end{aligned}$$

such that $\mathbf{u}^m \in H^1(0, T_m; \mathbf{V}_m)$, $\theta^m \in H^1(0, T_m; W_m)$ and $\phi^m \in L^\infty(0, T_m; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T_m; H^2(\Omega))$. Uniqueness of the approximate solution $(\mathbf{u}^m, \phi^m, \theta^m)$ is an easy consequence of the energy method and its further regularity follows from the regularity theory for parabolic equations (cf. e.g., [21]). Thus, Proposition 6.1 is proved. \square

6.2 Semi-Galerkin Approximation Type B: for global weak solutions in 2D

It has been shown in Section 4.1.2 that the weak maximum principle for θ (i.e., Lemma 3.4) plays an important role in obtaining global lower-order estimates of solutions to problem (1.3)–(1.8). However, in the semi-Galerkin approximation of Type A given in the previous section, the θ equation is approximated by the Galerkin ansatz and Lemma 3.4 does not apply any more. Hence, we shall make use of an alternative scheme, in which only the equation

(1.3) for the velocity \mathbf{u} is approximated by the Galerkin method. To this end, for every $m \in \mathbb{N}$ and arbitrary $T > 0$, we consider the following approximate problem (AP2): looking for functions

$$\mathbf{u}^m(t, x) = \sum_{i=1}^m g_i^m(t) \mathbf{v}_i(x), \quad \phi^m(t, x) \quad \text{and} \quad \theta^m(t, x)$$

such that

$$(AP2) \begin{cases} \langle \mathbf{u}_t^m, \mathbf{v} \rangle_{\mathbf{V}', \mathbf{V}} + \int_{\Omega} (\mathbf{u}^m \cdot \nabla) \mathbf{u}^m \cdot \mathbf{v} dx + 2 \int_{\Omega} \mu(\theta^m) \mathcal{D} \mathbf{u}^m : \mathcal{D} \mathbf{v} dx \\ \quad = \int_{\Omega} [\lambda(\theta^m) \nabla \phi^m \otimes \nabla \phi^m] : \nabla \mathbf{v} dx + \int_{\Omega} \theta^m \mathbf{g} \cdot \mathbf{v} dx, \quad \forall \mathbf{v} \in \mathbf{V}_m, \\ \phi_t^m + \mathbf{u}^m \cdot \nabla \phi^m + \gamma(-\Delta \phi^m + W'(\phi^m)) = 0, \quad \text{a.e. in } (0, T) \times \Omega, \\ \theta_t^m + \mathbf{u}^m \cdot \nabla \theta^m = \nabla \cdot (\kappa(\theta^m) \nabla \theta^m), \quad \text{a.e. in } (0, T) \times \Omega, \\ \phi^m = \phi_b, \quad \theta^m = 0, \quad \text{on } (0, T) \times \Gamma, \\ \mathbf{u}^m|_{t=0} = \mathbf{u}_{0m} := \Pi_m \mathbf{u}_0, \quad \phi^m|_{t=0} = \phi_0, \quad \theta^m|_{t=0} = \theta_0, \quad \text{in } \Omega. \end{cases}$$

Proposition 6.2. *Suppose $n = 2$. We assume that $(\mathbf{u}_0, \phi_0, \theta_0) \in \mathbf{H} \times (H^1(\Omega) \cap L^\infty(\Omega)) \times (H_0^1(\Omega) \cap L^\infty(\Omega))$, $\phi_b \in H^{\frac{3}{2}}(\Gamma)$ with $\phi_0|_{\Gamma} = \phi_b$ satisfying $|\phi_0| \leq 1$ a.e. in Ω and $|\phi_b| \leq 1$ on Γ . For every $m \in \mathbb{N}$, there is a time $T_m > 0$ depending on $\mathbf{u}_0, \phi_0, \theta_0, m$ and Ω such that problem (AP2) admits a unique solution on $[0, T_m]$ satisfying $\mathbf{u}^m \in H^1(0, T_m; \mathbf{V}_m)$, $\phi^m \in L^\infty(0, T_m; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T_m; H^2(\Omega))$ and $\theta^m \in L^\infty(0, T_m; H_0^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T_m; H^2(\Omega))$. Moreover, if we further assume $\phi_0 \in H^2(\Omega)$, $\phi_b \in H^{\frac{5}{2}}(\Gamma)$ and $\theta_0 \in H^2(\Omega)$, then $\phi^m \in L^\infty(0, T_m; H^2(\Omega)) \cap L^2(0, T_m; H^3(\Omega))$ and $\theta^m \in L^\infty(0, T_m; H^2(\Omega)) \cap L^2(0, T_m; H^3(\Omega))$.*

Proof. Again, the existence of local solutions to the approximate problem (AP2) on certain time interval $[0, T_m]$ follows from a fixed point argument. Let $T > 0$ and $M = 2 + 2\|\mathbf{u}_0\|^2$. Consider an arbitrary given vector

$$\mathbf{w}^m = \sum_{i=1}^m g_i^m(t) \mathbf{v}_i \in C([0, T]; \mathbf{V}_m)$$

with

$$g_i^m(0) = (\mathbf{u}_0, \mathbf{v}_i) \quad \text{and} \quad \sup_{t \in [0, T]} \sum_{i=1}^m |g_i^m(t)|^2 \leq M.$$

It is obvious that an estimate like (6.1) still holds for \mathbf{w}^m .

Step 1. We investigate parabolic equations for ϕ^m and θ^m with convection term under the given velocity \mathbf{w}^m . For ϕ^m , one shall consider the problem (6.2) again and obtain the same results as in *Step 1* of the proof for Proposition 6.1 (here we note that the temperature variable θ^m does not appear in the ϕ^m -equation (6.2)).

Next, we consider the equation for θ^m :

$$\begin{cases} \theta_t^m + \mathbf{w}^m \cdot \nabla \theta^m = \nabla \cdot (\kappa(\theta^m) \nabla \theta^m), & \text{a.e. in } (0, T) \times \Omega, \\ \theta^m = 0, & \text{on } (0, T) \times \Gamma, \\ \theta^m|_{t=0} = \theta_0(x), & \text{in } \Omega. \end{cases} \quad (6.11)$$

Well-posedness of problem (6.11) can be obtained by a standard Galerkin method (see e.g., [27]). Indeed, we can prove

Lemma 6.3. *Assume that $\mathbf{w}^m \in C([0, T]; \mathbf{V}_m)$, $\theta_0 \in H_0^1(\Omega) \cap L^\infty(\Omega)$. Then there exist a unique weak solution $\theta^m \in L^\infty(0, T; H_0^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T; H^2(\Omega))$ to problem (6.11).*

Then we derive some estimates for the weak solution θ^m to problem (6.11). It is easy to see that the weak maximum principle Lemma 3.4 now applies to θ^m , i.e.,

$$\|\theta^m(t)\|_{L^\infty} \leq \|\theta_0\|_{L^\infty}, \quad \forall t \in [0, T]. \quad (6.12)$$

By the continuity of $\kappa(\cdot)$, we see that $\kappa(\theta^m)$ has positive lower and upper bounds $0 < \underline{\kappa} < \bar{\kappa} < +\infty$ on $[0, T]$, which depend on $\|\theta_0\|_{L^\infty}$. Similar to (6.8), we have

$$\sup_{t \in [0, T]} \|\theta^m(t)\|^2 + 2\underline{\kappa} \int_0^T \|\nabla \theta^m\|^2 dt \leq \|\theta_0\|^2. \quad (6.13)$$

Concerning the H^1 -estimate for θ^m , we introduce the transformation $\vartheta^m = \int_0^{\theta^m} \kappa(s) ds$ and deduce the following equation for ϑ^m (cf. (3.6)):

$$\begin{cases} \vartheta_t^m + \mathbf{w}^m \cdot \nabla \vartheta^m - \tilde{\kappa}(\vartheta^m) \Delta \vartheta^m = 0, \\ \vartheta^m|_\Gamma = 0, \\ \vartheta^m|_{t=0} = \vartheta_0^m(x) = \int_0^{\theta_0(x)} \kappa(s) ds, \end{cases} \quad (6.14)$$

with $\underline{\kappa} \leq \tilde{\kappa}(\vartheta^m) \leq \bar{\kappa}$. Multiplying the above equation by $-\Delta \vartheta^m$ and integrating over Ω , we get

$$\begin{aligned} \frac{1}{2} \frac{d}{dt} \|\nabla \vartheta^m\|^2 + \underline{\kappa} \|\Delta \vartheta^m\|^2 &\leq \int_\Omega (\mathbf{w}^m \cdot \nabla \vartheta^m) \Delta \vartheta^m dx \\ &\leq \|\mathbf{w}^m\|_{\mathbf{L}^\infty} \|\nabla \vartheta^m\| \|\Delta \vartheta^m\| \\ &\leq \frac{\underline{\kappa}}{2} \|\Delta \vartheta^m\|^2 + \frac{C_m M}{2\underline{\kappa}} \|\nabla \vartheta^m\|^2, \end{aligned} \quad (6.15)$$

where we have used the fact (6.1) again to estimate $\|\mathbf{w}^m\|_{\mathbf{L}^\infty}$. By the Gronwall inequality, it holds

$$\sup_{t \in [0, T]} \|\nabla \vartheta^m(t)\|^2 + \underline{\kappa} \int_0^T \|\Delta \vartheta^m(t)\|^2 dt \leq \|\nabla \vartheta_0^m\|^2 (\underline{\kappa}^{-1} C_m M T + 1) e^{\underline{\kappa}^{-1} C_m M T},$$

which implies

$$\sup_{t \in [0, T]} \|\theta^m(t)\|_{H^1}^2 + \int_0^T \|\theta^m(t)\|_{H^2}^2 dt \leq K'(\|\theta_0\|_{H^1}, \|\theta_0\|_{L^\infty}, T, M, m, \underline{\kappa}, \bar{\kappa}). \quad (6.16)$$

We note that the constant K' on the right-hand side of (6.16) will be independent of T if $T \in (0, 1]$.

Next, we shall prove a continuous dependence result for problem (6.11) on its initial data and the given velocity field \mathbf{w}^m . Due to the restriction from Sobolev embedding theorems, this result is only available in the current regularity class for θ^m provided that the spatial dimension $n = 2$.

Let θ_1^m and θ_2^m be two weak solutions to problem (6.11) on $[0, T]$ corresponding to the initial data $\theta_{01}, \theta_{02} \in H_0^1(\Omega) \cap L^\infty(\Omega)$ and given vectors $\mathbf{w}_1^m, \mathbf{w}_2^m \in C([0, T]; \mathbf{V}_m)$, respectively. Denote the differences by $\bar{\theta}^m = \theta_1^m - \theta_2^m$, $\bar{\mathbf{w}}^m = \mathbf{w}_1^m - \mathbf{w}_2^m$. We can see that $\bar{\theta}^m$ satisfies

$$\begin{cases} \bar{\theta}_t^m + \mathbf{w}_1^m \cdot \nabla \bar{\theta}^m + \bar{\mathbf{w}}^m \cdot \nabla \theta_2^m \\ \quad = \nabla \cdot (\kappa(\theta_1^m) \nabla \bar{\theta}^m) + \nabla \cdot [(\kappa(\theta_1^m) - \kappa(\theta_2^m)) \nabla \theta_2^m], \\ \bar{\theta}^m|_\Gamma = 0, \\ \bar{\theta}^m|_{t=0} = \theta_{01} - \theta_{02} \quad \text{in } \Omega. \end{cases} \quad (6.17)$$

Multiplying the above equation by $\bar{\theta}^m$, integrating over Ω , by the Sobolev embedding theorem ($n = 2$), the Hölder inequality, Young's inequality and the estimates (6.12), we have

$$\begin{aligned}
& \frac{1}{2} \frac{d}{dt} \|\bar{\theta}^m\|^2 + \int_{\Omega} \kappa(\theta_1^m) |\nabla \bar{\theta}^m|^2 dx \\
&= - \int_{\Omega} (\mathbf{w}_1^m \cdot \nabla \bar{\theta}^m + \bar{\mathbf{w}}^m \cdot \nabla \theta_2^m) \bar{\theta}^m dx - \int_{\Omega} (\kappa(\theta_1^m) - \kappa(\theta_2^m)) \nabla \theta_2^m \cdot \nabla \bar{\theta}^m dx \\
&\leq \|\bar{\mathbf{w}}^m\|_{\mathbf{L}^4} \|\nabla \theta_2^m\|_{\mathbf{L}^4} \|\bar{\theta}^m\| \\
&\quad + \left\| \int_0^1 \kappa'(\tau \theta_1^m + (1-\tau) \theta_2^m) \bar{\theta}^m d\tau \right\|_{L^4} \|\nabla \theta_2^m\|_{\mathbf{L}^4} \|\nabla \bar{\theta}^m\| \\
&\leq C \|\bar{\mathbf{w}}^m\|_{\mathbf{V}} \|\nabla \theta_2^m\|^{\frac{1}{2}} \|\Delta \theta_2^m\|^{\frac{1}{2}} \|\bar{\theta}^m\| \\
&\quad + C \|\kappa'\|_{L^\infty} \|\nabla \theta_2^m\|^{\frac{1}{2}} \|\Delta \theta_2^m\|^{\frac{1}{2}} \|\bar{\theta}^m\|^{\frac{1}{2}} \|\nabla \bar{\theta}^m\|^{\frac{3}{2}} \\
&\leq \frac{\kappa}{2} \|\nabla \bar{\theta}^m\|^2 + \|\bar{\mathbf{w}}^m\|_{\mathbf{V}}^2 + L(t) \|\bar{\theta}^m\|^2,
\end{aligned} \tag{6.18}$$

where

$$L(t) = \frac{C}{\kappa^3} \|\nabla \theta_2^m\|^2 \|\Delta \theta_2^m\|^2 + C \|\nabla \theta_2^m\| \|\Delta \theta_2^m\|.$$

It follows from the estimate (6.16) and the Cauchy-Schwarz inequality that

$$\int_0^T L(t) dt \leq C(K', T) + \frac{C}{\kappa^3} \sup_{t \in [0, T]} \|\nabla \theta_2^m\|^2 \int_0^T \|\Delta \theta_2^m\|^2 dt < +\infty.$$

Then by (6.18) and the Gronwall inequality, we get

$$\|\bar{\theta}^m(t)\|^2 \leq \left(\|\theta_{01}^m - \theta_{02}^m\|^2 + \int_0^t \|\bar{\mathbf{w}}^m\|_{\mathbf{V}}^2 d\tau \right) e^{\int_0^t L(\tau) d\tau}, \quad \forall t \in [0, T].$$

As a consequence, the solution operator defined by problems (6.2) and (6.11)

$$\begin{aligned}
& \Phi^m : C([0, T]; \mathbf{V}_m) \rightarrow \\
& [L^\infty(0, T; H^1(\Omega) \cap L^2(0, T; H^2(\Omega))) \times [L^\infty(0, T; H_0^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T; H^2(\Omega))]
\end{aligned}$$

such that $(\phi^m, \theta^m) = \Phi^m(\mathbf{w}^m)$, is continuous.

Step 2. Once the functions ϕ^m and θ^m have been determined, we turn to look for a vector $\mathbf{u}^m(t, x) = \sum_{i=1}^m \tilde{g}_i^m(t) \mathbf{v}_i$ that satisfies a system of m nonlinear ordinary differential equations for $\{\tilde{g}_i^m(t)\}_{i=1}^m$ such that for $i = 1, \dots, m$,

$$\begin{cases} \langle \mathbf{u}_t^m, \mathbf{v}_i \rangle_{\mathbf{V}', \mathbf{V}} + \int_{\Omega} (\mathbf{u}^m \cdot \nabla) \mathbf{u}^m \cdot \mathbf{v}_i dx + 2 \int_{\Omega} \mu(\theta^m) \mathcal{D} \mathbf{u}^m : \mathcal{D} \mathbf{v}_i dx \\ \quad = \int_{\Omega} [\lambda(\theta^m) \nabla \phi^m \otimes \nabla \phi^m] : \nabla \mathbf{v}_i dx + \int_{\Omega} \theta^m \mathbf{g} \cdot \mathbf{v}_i dx, \\ \mathbf{u}^m|_{t=0} = \Pi_m \mathbf{u}_0, \quad \text{in } \Omega. \end{cases} \tag{6.19}$$

Due to our assumptions on the coefficients λ , κ and μ , it is standard to prove

Lemma 6.4. *Let $n = 2$, $\phi^m \in L^\infty(0, T; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T; H^2(\Omega))$ and $\theta^m \in L^\infty(0, T; H_0^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T; H^2(\Omega))$. Assume that $\mathbf{u}_0 \in \mathbf{H}$, then problem (6.19) admits a unique solution on $[0, T_2]$ such that $\mathbf{u}^m(t, x) = \sum_{i=1}^m \tilde{g}_i^m(t) \mathbf{v}_i \in H^1(0, T_2; \mathbf{V}_m)$, where $T_2 \in (0, T)$ may depend on M , ϕ^m , θ^m , m .*

In a similar way as before, we see that the estimate (6.9) still holds for \mathbf{u}^m and \mathbf{u}^m is bounded in $H^1(0, T_2; \mathbf{V}_m)$, by a constant depending on M, m . Besides, for the ODE system (6.19), it is standard to prove the continuous dependence on its initial data and ϕ^m, θ^m . As a consequence, the solution operator defined by problem (6.19)

$$\begin{aligned} \Psi^m : [L^\infty(0, T_2; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T_2; H^2(\Omega))] \\ \times [L^\infty(0, T_2; H_0^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T_2; H^2(\Omega))] \\ \rightarrow H^1(0, T_2; \mathbf{V}_m) \end{aligned}$$

such that $\mathbf{u}^m = \Psi^m(\phi^m, \theta^m)$, is continuous.

Step 3. From the previous steps, we see that the operator

$$\Psi^m \circ \Phi^m : C([0, T_2]; \mathbf{V}_m) \rightarrow H^1(0, T_2; \mathbf{V}_m)$$

such that $\Psi^m \circ \Phi^m(\mathbf{w}^m) = \mathbf{u}^m$, is continuous, where \mathbf{u}^m is the solution to problem (6.19). Again, compactness of $H^1(0, T_2; \mathbf{V}_m)$ into $C([0, T_2]; \mathbf{V}_m)$ implies that the operator $\Psi^m \circ \Phi^m$ is compact from $C([0, T_2]; \mathbf{V}_m)$ into itself. Thanks to our current choice of M and the estimate (6.9), we can find a time $T_m \in (0, T_2)$ to be sufficiently small such that $\|\mathbf{u}^m(t)\|^2 \leq M$ for all $t \in [0, T_m]$. The Schauder's fixed point theorem implies that there exists at least one fixed point \mathbf{u}^m in the bounded closed convex set

$$\left\{ \mathbf{u}^m \in C([0, T_m]; \mathbf{V}_m) \mid \sup_{t \in [0, T_m]} \|\mathbf{u}^m(t)\|^2 \leq M, \text{ with } \mathbf{u}^m(0) = \Pi_m \mathbf{u}_0 \right\}$$

such that $\mathbf{u}^m \in H^1(0, T_m; \mathbf{V}_m)$, $\phi^m \in L^\infty(0, T_m; H^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T_m; H^2(\Omega))$ and $\theta^m \in L^\infty(0, T_m; H_0^1(\Omega) \cap L^\infty(\Omega)) \cap L^2(0, T_m; H^2(\Omega))$. Uniqueness of the approximate solution $(\mathbf{u}^m, \phi^m, \theta^m)$ is an easy consequence of the energy method and its further regularity follows from the classical regularity theory for parabolic equations (cf. e.g., [21]). Thus, Proposition 6.2 is proved. \square
